ABSTRACTS FROM CONSULAR REPORTS.

CALCUTTA, INDIA.—The report of the health officer, K. McLeod, surgeon-major, for the month of October, states that 766 births and 1,068 deaths were registered. The annual birth-rate was 21.4, while the death-rate was 29.8 per 1,000. It is noted that the mortality among the mixed races was less than that among the pure, of whatever nationality.

SAGUA LA GRANDE, CUBA.—The commercial agent of the United States at this port states, under date of January 1, that the shipping is remarkably free from disease, and that no epidemic has prevailed in the town for a long time. During the month of December the weather was unusually cold, and some deaths from diphtheria and croup occurred among children. The chief cause of mortality is phthisis, and the disease is ascribed rather to the negligence of sanitary and hygienic conditions, and to the frequency of syphilitic infection, than to the climate.

TURK'S AND CAICOS ISLANDS, WEST INDIES.—The report for the week ending November 27 states that one death from yellow fever had occurred there during the week. Two deaths are reported from all causes in a population of 3,500. The patient who is said to have died from yellow fever was not a resident, but was landed from the steamship Santo Domingo while sick with the fever, and died soon after.

SAINT LOUIS, MO.—Dr. R. Luedeking forwards a report of mortality in Saint Louis for the year 1880, in which the population is estimated at 340,000 for the middle of the year, and the death-rate is stated as 18.9 per 1,000. The mortality from zymotic diseases has been less than that of the preceding year, in the proportion of 27.6 to 30.1 per cent. of all deaths.

The rate of infant mortality was rather higher than that of 1879, and the deaths under 5 years were 44.26 per cent. of the total. About one-half of these deaths were caused by pneumonia and convulsions; the latter being a convenient and indefinite name for a variety of infantile diseases. Cases so reported were, however, classified so far as it was possible to ascertain the cause. During the year, 7,299 births were recorded, but the number was probably greater.

SANITARY CONVENTION IN MICHIGAN.

Dr. B. Cogshall, secretary of the Michigan State board of health, announces that a sanitary convention will be held under the auspices of that board at the city hall of Flint, Mich., on January 25 and 26, 1881. Papers on subjects of general interest pertaining to the public health will be presented, and makers of all kinds of sanitary apparatus or appliances are requested to send specimens of their articles for examination. Certificates of merit will be awarded to such articles as may be judged worthy of the same.

Dr. James H. Wroth, of Camden, N. J., desires to correct the figures which are given in his report on smallpox, and printed in No. 28, page 633, as follows: "Total number of cases, 335; white 213, colored 122." On the fourth line below, read variola, 233 cases.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JANUARY 29, 1881. [No. 31.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul N. C. Stevens, in his reports for the three weeks ending November 27, states that this city remains in a bad condition. The native population of about 300,000 are crowded together, and careless and filthy in their habits and mode of living.

DUBLIN, IRELAND.—The United States consul forwards the report of Dr. Charles A. Cameron on the public health and sanitary condition of this city for the month of November. There were 126 deaths, against 230 in October; the annual rate was 36.5 per 1,000, which is considered very low as compared with that of previous monthly reports. A remarkable reduction in mortality from the zymotic diseases is noted in their total, but typhus fever shows a considerable increase. The admissions into hospitals, which will give an approximation to the *relative* prevalence of some diseases, were as follows: Small-pox, 9; typhus fever, 169; typhoid fever, 53; scarlet fever, 51; measles, 22.

As an example of the difficulties attending any effort to improve the sanitary condition of old cities, the following statement of Dr. Cameron may be cited: "In reference to the compulsory closing of tenement houses, cases of hardship frequently arise. Poor men have houses upon lease, which they sublet; when these houses are closed they must pay rent for them, though they receive none. If the leaseholder puts the house in proper repair the lessee may relet it, but very often the former has no capital to expend in this way, or if he were able to do so, his lease might have but a short time to run." An instance is given of seven houses which have been closed by the sanitary authorities for nearly a year. The lessee is unable to fit these houses for occupation, yet his landlord demands payment of rent, which the lessee does not receive. Dr. Cameron suggests that in such cases the lease-holder should be released by law from payment of rent to the landlord.

FOOCHOW, CHINA.—United States Consul J. C. Wingate reports, for the two weeks ending November 25, that this city of over one million inhabitants is still in a wretched sanitary condition, excepting the foreign settlement, which is healthy.

GHENT, BELGIUM.—United States Consul A. Lefebvre, in his report for the month of October, states that the sanitary condition of that city is improving. Only a few cases of measles and typhoid fever have been reported, and catarrhal diseases are most prevalent. There were 282 deaths, 305 births, and 104 marriages during the month. Among the principal cases of death were, scarlet fever 1, measles 1, diphtheria 4, typhoid fever 8, dysentery 1, puerperal diseases 2, consumption 46, other lung diseases 26, diarrhœa 74, diseases of the brain 9, of the heart 26. Eleven still-births not included in the report of deaths.

LONDON.—The report of the registrar-general for the week ending January 1, for 23 large towns in the United Kingdom, shows that the death-rates in those towns ranged from 16 per 1,000 for Newcastle-upon-Tyne, to 30 in Wolverhampton, Liverpool, and Nottingham. In London, 2,517 births and 1,648 deaths were registered. This number of deaths, compared with that for the preceding week, shows the small value of such estimates as applied to the annual mortality. That of London was 17.7 for the week previous, but an increase of deaths raised it to 23.5. This increase is said to be probably due to delay in the registration, owing to the fact that Christmas day fell upon Saturday.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton, under dates of December 9 and January 7, states that, in view of the prevalence of small-pox in Matamoros, he regards the exportation of such articles as might convey the disease to places in the United States as requiring attention. During the year 1879, about 44,000 pounds of woolen rags were shipped to New York via Brownsville, Texas. The consul suggests that either he or the collector of customs at Brownsville, acting under proper authority and instructions, could suppress this exportation for the present, or secure some measures of disinfection. In his last letter, Mr. Sutton states that one invoice of rags had been detained at his request, while awaiting instructions.

The last weekly report, for the week ending January 8, gives 10 deaths from small-pox out of 18 from all causes. The population being 16,000, the deaths from small-pox alone represent an annual death-rate of 32.5 per 1,000. The disease is chiefly confined to the poorer people, but this is the class which furnishes most of the rags for exportation.

SHANGHAI, CHINA.—United States Consul O. N. Denny forwards weekly reports up to December 14. He estimates the population of the native city at 300,000, and that of the suburbs at 150,000, while the foreign settlements have probably 150,000 more living in and about them. The mean temperature has been from 41° to 44°, and catarrhal diseases are prevalent; measles have been prevailing among the foreign population, but in a mild form. The authorities of the city are making an effort towards improvement of its sanitary condition by widening some of the streets.

SINGAPORE.—United States Consul A. G. Studer reports this city and vicinity free from epidemic or contagious diseases up to December 6.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

NEW YORK.—Under date of January 18, Dr. W. M. Smith, health officer, writes as follows concerning the issue of clean bills of health from infected ports:

Allow me to call the attention of the National Board to a frequent source of danger at this quarantine during the yellow-fever season. Having no official relation to the National Board, and desiring to give expression to my complaint, I have mentioned the subject in my report to the quarantine commission in the following language:

"Much embarrassment has been experienced from time to time during the season past by the character of consular and other bills of health from infected ports. In June last the governor of the Bahamas issued a proclamation declaring them infected with yellow fever; and long after reliable information had reached this department from other sources that yellow fever prevailed at Nassau, clean bills from that port were issued by the consul. Many cases of yellow fever had occurred at Key West during the past season before the health authorities at that port acknowledged its existence in bills of health. Well-marked cases of yellow fever were taken from vessels entering this port in more than one instance during the past season, where consular declarations were invoked to prove that the disease did not exist at the port of departure, but subsequent evidence of its existence was secured.

"August 22d the consul at Point-à-Pitre, Guadeloupe, declared 'that the number of deaths from yellow fever far exceed the number reported,' and that 'the authorities try to suppress all information on the subject.' These plain and honest declarations were as exceptional as they were instructive, and in marked contrast to the course of the consul at Martinique, who, it is asserted, gave clean bills of health long after the British consul refused to give clean bills on account of the prevalence of yellow fever at that port. The conclusion has been fully established from many instances such as have been referred to, that consular agents are too frequently influenced by commercial or other interests at the place of their official residence to act independently in this matter. Ignorance of the actual state of the public health from concealment by the health authorities undoubtedly contributes to make these occurrences more frequent.

The extensive commerce now existing between ports in which yellow fever is endemic, and the numerous ports in our own country within the yellow-fever zone, demands on the part of our own representatives, at ports where this disease exists, or where it is liable to occur, the utmost vigilance and conscientiousness in their reports through bills of health or otherwise.

The National Board of Health has rendered good service in correcting this difficulty at Havana. Its paid representative at that port, a physician of established reputation, fills up the bills of health, and the consul-general certifies to that fact. This arrangement has given entire satisfaction at this port. It is to be earnestly hoped that the co-operation of the State Department at Washington will be given to enable the National Board to introduce its forms of bills of health in every port liable to be infected with yellow fever.

It is scarcely to be expected that the National Board, with its present financial resources, can establish medical representatives at even the principal ports of the West Indies. From consular agents, therefore, in the future as in the past, must be obtained the only representations as to the health of the ports to which they are accredited for the guidance of the officers of quarantine. Should the general government, through the Secretary of State, consider it proper to urge upon consuls the necessity of a careful consideration of the character and extent of diseases prevalent within their official jurisdiction, and a conscientiously faithful representation of the facts, it is believed much more reliable information would be given to the health authorities at our quarantine.

Dr. Smith, under date of January 20, adds the following remarks upon the quarantine of New York:

The number of vessels arriving at the port of New York from ports infected or liable to be infected by yellow fever, between May 15, 1880, and the 1st of November following was 968.

The number of vessels arriving from ports actually infected, 291.

The number of vessels that had sickness at the port of departure, or on the passage to this port, 137.

The total number of cases admitted to the quarantine hospital during the season was 99.

Forty-five of this number were severe cases of typho-malarial fever, and twenty-six of the ordinary malarial fever of tropical or semi-tropical climates—total, 71; of this number seven died.

Twenty-seven cases of yellow fever have occurred, of which ten proved fatal. Three of the fatal cases died in quarantine before removal to hospital, and one was moribund when admitted.

The cases of typho-malarial fever arriving on vessels from Port de Paix, with logwood, were particularly severe.

The bark *Treci Dubroracki* arrived at lower quarantine from Port de Paix, with logwood, June 24. Soon after leaving for New York (June 4 and 5), two of her crew were taken sick but recovered. June 6 another seaman was taken sick and died the 10th of the same month. On the last-mentioned date six others were taken and were sick when the vessel arrived. June 15 the captain sickened and died the day before reaching port. There was no record of the date when others were taken sick, as the mate and a boy were all that remained to do duty. Eleven men were sent to the quarantine hospital, of whom three died, one being moribund when admitted. Two of the crew had died on the passage. In a crew of fifteen "all told," all had been or were sick on arrival, and one-third of the number died.

September 18 the bark *Erinagh* from Port de Paix, with logwood, navigated by ten men when she left that port, arrived at lower quarantine in tow of the steamship *City of Washington*. This vessel had eight men sick on the passage, two of whom died before reaching port. Four men and one boy were sent to the hospital on arrival. When picked up by the *City of Washington* the *Erinagh* was in a helpless condition, in mid-ocean, for want of well men to navigate her.

The condition of these vessels was extremely filthy. The malarial influence of this pestilential locality was superadded to the effects of the ill-conditioned cargo, and the crowded, badly ventilated, and terribly foul forecastle in which sick and well were huddled together.

The brig *Oliver Cutts*, from Port de Paix, with logwood, navigated by nine men, arrived July 2. Seven men were sick on the passage; one of them had died at sea; four were removed to hospital on the day of arrival, and two others the day following.

August 6, the schooner *A. J. Fabens* entered quarantine from Port de Paix, with logwood, navigated by seven men. The captain, mate, and steward were sick and were sent to hospital. On the 7th, two seamen were also removed to hospital. The condition of the *Oliver Cutts* and *A. J. Fabens* was much more cleanly than the other vessels to which reference has been made, and the cases of fever were proportionately mild in their course and fortunate in their result.

The sickness on these vessels has been referred to to call attention to facts which are well known to quarantine officials, and often not a little embarrassing.

Fever of this type, as also that which is known as pernicious fever, has many symptoms during the initial stages in common with yellow fever. And as those cases usually come from localities in which yellow fever frequently occurs, or prevails as an endemic, their admission to the city would occasion frequent alarm; particularly when, as has occurred during the past season, yellow fever has been removed from the same vessel with cases of malarial and typho-malarial fever. However confident the medical officer at quarantine may be that the case is not yellow fever, it is a wise precaution, for reasons stated, to send these cases to the quarantine hospital for observation and treatment.

The cases which are designated as typho-malarial have different morbific elements which unite to produce the type mentioned. 1st. The malarial poison, whatever that may be, generally received among the marshes and lowlands which border many of the ports in a tropical or semi-tropical climate, and perpetuated by the ill condition of the cargo. The logwood which constitutes the cargo is usually dragged through the water some distance, and stowed under the hatches, thoroughly saturated with water. 2d. The dietetic deficiency which often exists among seamen; and, 3d. The insufficiently ventilated, crowded, and filthy condition of the forecastle.

The malarial element in these cases was doubtless the original cause, and the typhus symptoms which gave the cases a serious aspect, and sometimes fatal results, the consequence of unsanitary conditions. Except those cases which entered the hospital moribund, or desperately ill, all, with one exception, recovered under the use of quinine, the moderate use of stimulants, and a liberal supply of nourishment. The fatality in the exceptional instance was the result of complications as unexpected as they were unusual.

The decision of the Surgeon-General which denies to this class of cases aid from the United States authorities at this port, has, during the past season, resulted in considerable embarrassment and loss to the superintendent of the quarantine hospital.

Shippers engaged in the logwood trade would find it a measure of economy of money, human life, and suffering to employ lighters of considerable draft to convey the logwood from the shore to the vessel, instead of dragging it through the water, as is done, and in a thoroughly wet condition, stowing it in the vesssel, where often for weeks subsequently it is subjected to the influence of tropical heat.

The theory of quarantine is based upon methods whereby the poison germs of infectious and contagious disease are destroyed.

During the past season no vessel has been compelled to receive her cargo in quarantine; nor has any been detained longer at the discharging anchorage than sufficed to discharge cargo, cleanse and disinfect. Even in the largest steamships in the trade with the West Indies, this is often accomplished in from two to three days—in less time than the same work could be done at the dock, owing to the facility with which lighters can be employed on both sides of the vessel.

HAVANA, CUBA.—During the week ending January 7 there were 4 deaths from yellow fever, of which 2 were among the citizens and 2 in the military hospitals. From small-pox, there were 13 deaths in Havana, and the disease is reported to be prevailing in other places, especially to the westward.

FERNANDINA, FLA.—The following resolution concerning the quarantine station at Sapelo Sound has been adopted by the local board of health:

At a meeting of the board of health, held on the 5th day of January, 1881, the following resolution was adopted:

"*Resolved by the Board of Health of the city of Fernandina, Fla.*, That we regard the action of the National Board of Health in establishing a health and quarantine station on Blackbeard Island, Sapelo Sound, Ga., as tending very greatly towards the prevention of epidemics being introduced from foreign ports along the Southern Atlantic coast, and a measure absolutely necessary towards the prevention of dangerous epidemics. We therefore most earnestly call the attention of the Representatives in Congress, and especially the Representatives from Florida and Georgia, to the urgent necessity of an appropriation to carry on said health station, and ask them to present this matter before Congress at the earliest moment."

The clerk was instructed to forward a copy to the National Board of Health at Washington, D. C., and to each of our Representatives.

C. A. HALEY,
Mayor and Chairman Board of Health.

W. F. WOOD, Jr., *Clerk.*

Allegheny, Pa., 78,000; deaths, 14; under 5 years, 7; cerebro-spinal meningitis 1, consumption 1, diphtheria 2, scarlet fever 2, pneumonia 2, bronchitis 1. Bath, Me., 8,000; deaths, 2; croup 1. Belfast, Me., 5,308; deaths, 2; consumption 1, congestion of lungs 1. Bowling Green, Ky., 6,000; deaths, 2; under 5 years, 1; Bucyrus, Ohio, 3,950; death, 1. Brattleborough, Vt., 6,000; no deaths. Calais, Me., 6,162; deaths, 2; congestion of lungs 1, old age 1. Carrollton, Miss., 600; no deaths. Chillicothe, Ohio, 11,000; deaths, 3; under 5 years, 2; old age 1. Circleville, Ohio, 6,000; deaths, 3; pneumonia 1, bronchitis 1. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 7; accidents 2, consumption 3, pneumonia 1. Corinth, Miss., 2,264; deaths, 3; under 5 years, 2; cerebro-spinal meningitis 1, bronchitis 1. Crystal Springs, Miss., 955; death, 1. Dallas, Tex., 10,630; deaths, 5; under 5 years, 1; consumption 3. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Flint, Mich., 9,000; deaths, 3; accident 1, consumption 1. Gunn City, Mo., 150; no deaths. Huntingdon, Pa., 4,500; no deaths. Huntingdon, Tenn., 1,200; deaths, 3; under 5 years, 2; accidents 2, old age 1. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; deaths, 2, under 5 years. Kenosha, Wis., 5,500; deaths, 3; under 5 years, 1; diphtheria 2. LaSalle, Ill., 8,885; deaths, 2; under 5 years, 1; consumption 1, measles 1. Louisiana, Mo., 5,200; congestion of lungs 1. Madison, Ind., 9,000; deaths, 2; consumption 1. Marquette, Mich., 4,000; no deaths. Martinsburg, W. Va., 6,384; deaths, 3; under 5 years, 2; croup 2, puerperal 1. Meridian, Miss., 4,000; deaths, 2; consumption 1. Milan, Tenn., 1,800; consumption 1. Milledgeville, Ga., 3,000; deaths, 3; under 5 years, 1; consumption 1, pneumonia 1, old age 1. Monmouth, Ill., 6,000; deaths, 4; diphtheria 1, old age 1. Morton, Miss., 200; no deaths. Mount Pleasant, Iowa, 4,500; death, 1, under 5 years. Muscatine, Iowa, 8,412; deaths, 2; consumption 1, scarlet fever 1. Muskegon, Mich., 11,300; deaths, 3; consumption 1, congestion of lungs 1, old age 1. Nebraska City, Nebr., 5,200; deaths 2; consumption 1, pleurisy 1. Niles, Mich., 4,200; deaths, 2; under 5 years, 1. Painesville, Ohio, 5,500; puerperal 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,700; deaths, 2; consumption 1. Pleasant Hill, Miss.; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; accident 1. Rensselaer, Ind., 900; no deaths. Rock Island, Ill., 12,000; deaths, 5; under 5 years, 2; cerebro-spinal meningitis 1, croup 1, scarlet fever 1. Santa Cruz, Cal., 5,000; no deaths. Springfield, Ohio, 21,000; deaths, 10; consumption 1, croup 1, malarial fever 1, old age 2. Starkville, Miss., 1,454; no deaths. Steubenville, Ohio, 13,500; deaths, 5; under 5 years, 3. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; deaths, 2; typhoid fever 1. Tuscaloosa, Ala., 2,000; death, 1, under 5 years. Winchester, Va., 5,000; deaths, 3; accident 1. Winona, Minn., 10,000; pleurisy 1. Youngstown, Ohio, 15,089; deaths, 3; under 5 years, 1; accident 1, typhoid fever 1, pneumonia 1. Total population, 390,800; deaths under 5 years, 33; total number of deaths, 123; annual rate per 1,000, 16.4.

NOTICE.

The attention of health officers and others who fill the weekly reports of mortality in cities of the United States, is especially invited to the change of form in the cards, and in the table compiled from them. In the column for the number of deaths, white and colored, those places only will hereafter be noted whose reports are definitely known to separate the diseases and the deaths of the two races, and which can furnish the respective populations. All populations not agreeing with those previously given have been changed in accordance with the figures furnished by the Census Bureau, and remain subject to correction from that office.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JANUARY 15, 1881.

State.	Cities.	Total population, according to the United States census of 1880.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Population according to United States census of 1880.		Number of deaths.		Annual death-rate per 1,000.		Population under 5 years.		Number of deaths under 5 years.		Annual death-rate per 1,000.		Accidents.		Cerebro-spinal meningitis.		Consumption.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, FEBRUARY 5, 1881. [No. 32.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

ABSTRACTS FROM CONSULAR REPORTS.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton, under date of January 8, states that since his last note concerning the exportation of rags suspected of infection from small-pox, the invoice mentioned as being detained has been held with consent of the shipper while awaiting instructions. Dr. C. B. Combe, inspector for the National Board of Health, informs the consul that such rags could be safely and economically disinfected at Matamoros before exportation. Should this not prove practicable, the consul recommends prohibition of the exportation.

PARA, BRAZIL.—United States Consul A. C. Prindle reports for the month of December 124 deaths in a population of 40,000, giving an annual death-rate of 36.5 per 1,000. Among the causes of death were: typhus fever 2, typhoid fever 1. The prevailing diseases were the several forms of malarial fevers.

SINGAPORE.—United States Consul A. G. Studer reports his district free from infectious diseases up to December 20. In November there were 295 deaths, of which fevers caused 81, diarrhœal diseases 56, consumption 20, other lung diseases 11, leprosy 2.

In addition to the above deaths in 1880, there were 119 still-births, or 3 less than in 1879. Of the 119 still-born children, 75 were males, 44 females; 63 of American and 56 of foreign parentage.

The population of Providence, by the census of 1880, was 104,852.

so that the 2,980 deaths in the same year give as the rate of mortality 19.84 deaths in each 1,000 of the population, or one death in 50.41. In 1879 the rate was 19.57 in each 1,000, or 1 in 51.09. The average annual rate of mortality in Providence for twenty years past, with census of population and full returns of deaths, has been less than 20 in each thousand of the population.

During the year 1880 there were 1,313 persons vaccinated at the office of the superintendent of health, or 153 more than in 1879, and 1,370 certificates of vaccination were given to children to attend the public schools, or 75 less than in 1879. There has been no case of small-pox in Providence for several years past, and only one death from this disease since May, 1873, a period of seven years and eight months.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—Dr. C. B. Combe, inspector for the National Board of Health, writes, under date of January 13, that small-pox is still epidemic, but is decreasing under the general vaccination, isolation, and disinfection which have been used for some time. The surgeon in charge at Fort Brown has had but two cases among the troops, and has used all precautions to check the spread of the disease; only two cases have occurred among the American residents of Brownsville. The disease is almost confined to the poorer class of Mexicans, who suffer greatly in their wretched huts, or *jacals*, especially during the late cold weather. It is urged that rags sent from Brownsville to other parts of the United States be disinfected before shipment, as well as those from Matamoros.

From the official report from Matamoros it appears that there were 19 deaths from small-pox in October, 51 in November, and 73 in December.

HAVANA, CUBA.—During the week ending January 21 there were two deaths from yellow fever and 18 from small-pox. Only 8 deaths from yellow fever have been reported for the first three weeks of January.

NEW HAVEN, CONN.—The report of Dr. C. W. Chamberlain, of Hartford, secretary of the state board of health, is given for the last two months of 1880. The report indicates increased activity in sanitary matters in the principal cities, and improved conditions resulting. Diphtheria has prevailed extensively, but not of very fatal type; of scarlet fever no great number of cases have been reported. Typhoid fever has been unusually prevalent, especially among Swedish emigrants, and malarial fevers were common during their season. The general health of the State has not been as good during the year 1880 as in the two years preceding. Lung diseases have been more frequent, and local epidemics of typhoid fever and of diphtheria have appeared, while whooping cough and measles have prevailed through the whole State. Few children escaped the measles, and instances of second, and even of third attacks were not uncommon.

SAINT LOUIS, MO.—Dr. Charles W. Francis, health commissioner, reports, for the year 1880, a total of 6,635 deaths in a population of 350,522 (United States census), giving an annual death-rate of 18.9 per 1,000. The greatest mortality was during the summer months, being 2,031, against 1,418 for the winter months. Some of the principal causes of death were: cerebro-spinal meningitis 36, consumption 786, pneumonia 539, croup 61, diphtheria 113, scarlet fever 46, measles 55, typhoid fever 139, malarial fevers 241, whooping cough 79, puerperal 61, diarrhœal diseases 649, of which 488 were under 5 years of age. The deaths under that age were 44.26 per cent. of the total. There were 7,339 births and 1,181 marriages reported, but the returns were not complete.

The following reports for the week ending January 22, 1881, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 5; under 5 years, 1; consumption 1, croup 1, diphtheria 1, pneumonia 2. Allegheny, Pa., 78,000; deaths, 27; under 5 years, 10; accident 1, cerebro-spinal meningitis 1, consumption 6, diarrhœa 1, diphtheria 1, scarlet fever 2, pneumonia 5. Bath, Me., 8,000; deaths, 3; accident 1, old age 1. Belfast, Me., 5,300; deaths, 3; croup 1, diarrhœa 1, old age 1. Bowling Green, Ky., 6,000; deaths, 3; under 5 years, 2; pneumonia 2. Brattleborough, Vt., 6,000; no deaths. Bucyrus, Ohio, 3,950; deaths, 2; under 5 years 1; consumption 1. Calais, Me., 6,162; consumption 1. Carrollton, Miss., 600; consumption 1. Chillicothe, Ohio, 11,000; deaths, 4; under 5 years, 1; consumption 2, pneumonia 1. Circleville, Ohio, 6,000; deaths, 4; under 5 years, 1; consumption 2, erysipelas 1. Columbus, Ga., 10,000; deaths, 9; under 5 years 2; consumption 1, scarlet fever 1, pneumonia 4. Corinth, Miss., 2,260; one death under 5 years. Crystal Springs, Miss., 955; no deaths. Dallas, Tex., 10,327; deaths, 7; under 5 years, 3; diarrhœa 2, pneumonia 3. Fayette, Miss., 400; no deaths. Gunn City, Mo., 125; no deaths. Hernando, Miss., 1,000; bronchitis 1. Huntingdon, Pa., 4,500; deaths, 2; under 5 years, 1. Huntingdon, Tenn., 1,200; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 1,000; no deaths. Jefferson, Tex., 3,250; no deaths. Kenosha, Wis., 5,500; deaths, 3; under 5 years, 1; diphtheria 1, pneumonia 1, old age 1. La Salle, Ill., 8,885; deaths, 2; under 5 years, 1; consumption 1, croup 1. Louisiana, Mo., 4,300; consumption 1. Madison, Ind., 9,000; deaths, 7; under 5 years, 2; congestion of lungs 1. Marquette, Mich., 4,040; deaths, 3; pneumonia 2. Martinsburg, W. Va., 6,854; old age 1. Meridian, Miss., 4,000; deaths, 2; under 5 years, 1; bronchitis 1. Milledgeville, Ga., 3,000; no deaths. Morton, Miss., 205; whooping cough 1, under 5 years. Mount Pleasant, Iowa, 4,500; one death, under 5 years. Muscatine, Iowa, 8,400; deaths, 6; under 5 years, 2; accident 1, scarlet fever 1, small-pox 1, diarrhœa 1. Muskegon, Mich., 11,300; deaths, 8; under 5 years, 1; consumption 3, diphtheria 1. Niles, Mich., 4,200; no deaths. Okolona, Miss., 2,000; deaths, 2; pneumonia 1. Painesville, Ohio, 5,500; deaths, 4; under 5 years, 3; croup 1, scarlet fever 1, congestion of lungs 1. Pass Christian, Miss., 2,000; one death, under 5 years of age. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; deaths, 2; consumption 1. Pleasant Hill, Miss., 233; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; puerperal 1. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; diphtheria 1. Rock Island, Ill., 12,000; deaths, 6; under 5 years, 1; cerebro-spinal meningitis 1, consumption 1, diphtheria 1, whooping cough 1. Santa Cruz, Cal., 5,000; deaths, 2; consumption 1, old age 1. Springfield, Ohio, 21,000; deaths, 11; under 5 years, 2; consumption 2, diphtheria 2. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; one death. Tuscaloosa, Ala., 4,000; no deaths. Watertown, Wis., 10,000; old age 1. Winchester, Va., 5,000; deaths, 2; typhoid fever 1. Winona, Minn., 10,000; deaths 2; under 5 years, 1; diarrhœa 1, puerperal 1. Youngstown, Ohio, 15,090; deaths, 7; under 5 years, 2; diarrhœa 1, diphtheria 1, erysipelas 1, malarial fever 1, bronchitis 1. Total population, 362,641; deaths under 5 years, 41; total number of deaths, 151; annual rate per 1,000, 21.7.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, FEBRUARY 12, 1881. [No. 33.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

PROPOSED SANITARY LEGISLATION IN WEST VIRGINIA.

SENATE BILL NO. 35.

A bill to establish a State board of health and vital statistics, and regulating the practice of medicine and surgery.

Be it enacted by the legislature of West Virginia: [SEC. 1.] The governor shall appoint, within sixty (60) days from and after the passage of this act, two physicians from each Congressional district, who shall be graduates of respectable medical colleges, and of not less than twelve (12) years continuous practice in their profession, and have distinguished themselves by attention to the study of sanitary science, who shall constitute the State board of health.

The terms of office of the persons so appointed shall be so arranged that the terms of two of them shall expire at the end of every second year. Vacancies in the board shall be filled, by re-appointment or otherwise, by the same appointing power.

SEC. 2. The board so appointed shall take the oath of office prescribed by the constitution for other State officers, and receive from the secretary of state certificates of their appointment.

SEC. 3. The board shall meet within twenty (20) days after receiving notice of their appointment, at such time and place as the first-named member of the board shall designate; and shall organize by the election of a president and secretary from their own number, who shall occupy such positions until their successors are elected; and they may adopt all necessary rules, regulations, and other articles for the dispatch of business. A majority of the board shall constitute a quorum; and they are authorized to send either the secretary or president, or a special committee of the board, to consult and co-operate with the National Board of Health, the State boards of health of other States, or other sanitary organizations, whenever they may deem it necessary for the public good.

SEC. 4. The secretary shall be the executive officer of the board; shall superintend and perform the work prescribed in this act, and perform such other duties as the board shall direct; shall respond to all communications of the local boards of health, hereinafter provided for, and give such instructions as may be deemed necessary; and in case of the prevalence of endemics, epidemics, infections and contagious diseases, or other unusual sickness, he shall visit the locality and adopt such regulations for its suppression as may seem best. He shall annually report to the governor on or before the first day of January the investigations, discoveries, and recommendations of the board, which shall be printed and distributed as soon as practicable thereafter, in the same manner as other public documents of the State.

SEC. 5. The board shall take cognizance of the interests of life and health among the inhabitants of the State; shall make or cause to be made sanitary investigations and inquiries respecting the causes of diseases, especially of endemics and epidemics and the means of prevention; the sources of mortality, and the effects of localities, employments, habits, and circumstances of life on the public health. They shall also investigate the causes of diseases occurring among the stock or domestic animals in the State, the methods of remedying the same; and shall gather information in respect to these matters and kindred subjects for diffusion among the people. They shall also, when requested, advise with regard to the location, drainage, water supply, heating, and ventilation of public buildings, the ventilation of coal mines, and the drainage and sewerage of towns and cities.

When they may believe there is a probability that any infectious or contagious disease will invade this State from any other State, it shall be their duty to take such action and adopt and enforce such rules as they may in the exercise of their discretion deem efficient in preventing the introduction and spread of such disease or diseases. The better to accomplish such objects, the board are empowered and directed to establish and strictly maintain quarantine at such places as they deem proper, and may adopt rules and regulations to obstruct and prevent the introduction or spread of infectious or contagious diseases to or within the State. They may enforce inspections of persons and articles of baggage or other goods of whatsoever character, as well as the purification of the same; that all companies or individuals operating or controlling railroads, steamboats, coaches, public conveyances and steamers plying the Ohio River or its tributaries in this State, shall obey the rules and regulations when made and published by the State board of health; and any owner or owners, person or persons, having charge of any railway train, passenger coach, steamboat, or public or private conveyance, who shall refuse to obey such rules and regulations when made and published shall be held to have committed a misdemeanor, and for each offense shall be punished by a fine not less than fifty ($50) dollars, nor more than five hundred ($500) dollars, or be confined in the county jail not less than fifteen (15) days nor more than two (2) months, or be either so fined or imprisoned, or both, in the discretion of the court or jury trying the case, to be recovered in any court of competent criminal or penal jurisdiction.

SEC. 6. It shall be the duty of the State board of health to appoint three (3) persons, one of whom, at least, shall be a legally qualified practicing physician, citizens residing in each county of this State, who shall constitute a *local board of health* for the respective counties in which they reside, and such persons, as members of the local board, shall hold their office for the term of two (2) years from the date of their appointment; and such local boards are empowered, and it shall be their duty to inaugurate and execute, and require the heads of families to execute, such sanitary regulations as the local board may consider necessary to prevent the outbreak and spread of cholera, small-pox, scarlet fever, diphtheria, and other endemic, epidemic, infectious, and contagious diseases; and they are empowered to go upon and inspect any premises which they may believe are in an unclean or infectious condition; and the said local board are authorized to enforce the rules and regulations of the State board of health. And if shall be the duty of physicians practicing in any county in which a local board is organized, to report promptly all or any of the above-named character of diseases under their special treatment to such local board; and such local board shall make report of the same to the State board of health at least once in every three (3) months—first, of the character of the infectious, contagious, endemic or epidemic disease prevailing in their county; second, the number of persons reported as infected with such disease; third, the action taken by such local board to arrest the progress of such prevalent disease, and the visible effects of such action. The said local board shall receive such compensation for their services as the county court in its discretion determine.

The provisions for local boards of health shall not apply to cities and towns having boards of health, but where such local boards of health are already established in cities and towns, they shall be auxiliary to, and act in harmony with, the State board of health, and shall be required to enforce a system of registration of vital statistics, as hereinafter provided, and shall report the same to the State board of health within the first three (3) days of each month.

SEC. 7. In the counties bordering on the Ohio River and its tributaries, on the State line separating West Virginia from the State of Ken-

tucky, the local boards of health are empowered to declare quarantine in said county or counties, or in any particular place or places therein, against the introduction of any contagious or infectious diseases prevailing in any other State or county: *Provided*, That as soon as such quarantine is established the local board declaring the same through its presiding or chief officer shall, in writing, notify the State board of health of such quarantine and the extent thereof, and thereupon the State board of health, in the exercise of its supervising power over local boards, shall, as early as practicable, ascertain the necessity of such quarantine, and shall either approve of and enforce the said quarantine or declare the same raised.

SEC. 8. The State board of health and its agents, employés, or the local boards of health, acting under the direction and regulations of the State board, when they have reasonable grounds to believe that any packet or other steamboat, barge, or other water craft navigating the Ohio River or its tributaries, is infected with any infectious or contagious disease, are empowered to prevent the landing of such craft at any point on the West Virginia shore; and they are also empowered, when they have reasonable grounds to believe that any such railway train, coach, or other vehicle contains persons or goods, of whatsoever character, infected with contagious matter, to detain at any station or point on such railway or road such train, coach, or vehicle, for a time sufficient to disinfect and purify the same: *Provided*, Quarantine has been established at such station or place by action of such boards; and any railway conductor or person in charge of the same who shall willfully avoid or prevent the inspection, disinfection, and purification of the conveyances above named in his control shall be guilty of a misdemeanor and liable to the penalty hereinbefore mentioned, to be recovered in the court of any county where the offense has been committed.

SEC. 9. The State board of health shall have supervision of a system of registration of marriages, births, and deaths, and have charge of the vital and mortuary statistics of the State; and all physicians, coroners, and midwives shall be required to report to the clerk of the county in which they reside all necessary information, as shall be required of them by the State board of health, pertaining to all births and deaths coming under their supervision or notice, such reports to be made within ten (10) days from the date of their occurrence. The clerk in each county shall keep in his office two books, one of which shall be known as the register of births, the other to be known as the register of deaths, which books shall have suitable columns for the entry of all facts required by the State board of health. The said registry of births shall record the time of birth, the name of the father, the maiden name of the mother, the place of birth of the parents, the place of present residence of the parents, the occupation of the father, the sex and color of the child, and the fact of its being born alive or dead. In case two or more persons shall have attended at any such birth, the physician or midwife last in attendance shall furnish the certificate of birth, and shall make return of the same within ten (10) days to the clerk of the county. In the absence of such physician, surgeon, or midwife, the father or mother of the child shall make such return and be alike responsible therefor. Any person failing to comply with the terms of this section shall suffer and pay a fine of not less than five (5) dollars nor more than ten (10) dollars for each offense.

SEC. 10. Within thirty-six (36) hours from the time of death of any person within the limits of this State, and before the removal of the body for interment, the undertaker or other person having charge of the same shall obtain from the physician who had charge of the case, or, in the absence of a physician, from the family of the deceased, or housekeeper where the death occurred, all the facts connected with the said death, and shall certify as to said death the name, age, sex, color, occupation, place of birth, the exact locality of the place of death, the cause of death, the duration of the disease, the physician, surgeon, or midwife in attendance, and the fact of being married or single. On the first Monday of each month, every undertaker or other person who shall have taken charge of the interment of the body of any such person shall make report in writing to the clerk of his county of the number of interments under his charge during the preceding month, and the time and place of burial. The penalty for violation of this section shall be a fine of ten (10) dollars for each offense.

SEC. 11. It shall be the duty of the State board of health to prepare and provide such blank forms for the record of all marriages, births, and deaths; the said printed forms and registry books to be provided by the county clerk, at the expense of the counties; and it shall also be the duty of recorders to make record of all returns from physicians, midwives, and undertakers in the aforementioned books, and to furnish physicians, midwives, and undertakers with printed blanks for report concerning all matters required by the State board of health.

SEC. 12. Any person practicing medicine in any of its departments shall possess the qualifications required by this act, viz: If a graduate in medicine, he shall present a diploma to the two members of the State board of health in his congressional district for verification as to its genuineness. If the diploma is found to be genuine and issued by a reputable medical college, and recognized as such an institution by the State board of health, and if the person named therein be the person claiming and presenting the same, the said two members of the State board of health shall issue a certificate to that effect; and such diploma and certificate shall be conclusive as to the right of the lawful holders of the same to practice medicine in the State of West Virginia. If not a graduate of such medical college as above designated, every person practicing medicine in this State shall present himself before the two members of the State board of health in his congressional district and submit himself to such examination as the said district members shall require; and if the examination be satisfactory they shall issue a certificate in accordance with the facts, and the lawful holder of such certificate shall be entitled to all the rights and privileges herein mentioned, except that physicians who have been engaged in the continuous practice of medicine in this State for more than ten years at the date of the passage of this act shall, in lieu of a diploma or examination by the members of the State board of health, present to the said board an affidavit as to the number of years they have been engaged in the practice of medicine, and the said board shall issue its certificate to such physicians without requiring an examination, but this section shall not apply to members of the Medical Society of the State of West Virginia. The members of the State board of health in each congressional district shall give not less than 10 days public notice of the time and place of their meetings, in order to accommodate applicants for certificates.

SEC. 13. Every person holding a certificate from the State board of health shall have it recorded in a book kept for that purpose by the clerks of the county courts in the several counties in the State, and the record indorsed thereon. Any person removing to another county to practice shall procure an indorsement to that effect on the certificate from the said clerk of the county, and shall record the certificate in like manner in the county to which he removes. The fee of the clerk for recording a certificate issued by the State board of health to enable a holder to practice medicine shall be one dollar.

SEC. 14. Each candidate, on presenting himself for examination, shall pay a fee of ten dollars, which shall be returned to him if a certificate be refused. In case an applicant for a certificate fails to pass a satisfactory examination, the person may, in three months thereafter, appear again before the board for a second examination, which second examination shall be final. If said second examination shall be satisfactory to the board, a certificate shall be given, for which the candidate shall pay ten dollars.

SEC. 15. Examination may be, in whole or in part, in writing, and shall be of an elementary and practical character, and shall embrace the general subjects of anatomy, physiology, chemistry, materia medica, pathology, pathological anatomy, surgery, and obstetrics, but sufficiently strict to test the qualifications of the candidate as a practitioner of medicine, surgery, and obstetrics. This section shall not apply to females practicing midwifery at the passage of this bill.

SEC. 16. The State board of health may refuse certificates to individuals guilty of unprofessional or dishonorable conduct, and they may revoke certificates for like causes.

SEC. 17. Any person shall be regarded as practicing medicine, within the meaning of this act, who shall profess publicly to be a physician, and to prescribe for the sick, or who shall append to his name the letters "M. D." This act shall also apply to apothecaries and pharmacists, and other persons who prescribe for the sick. This act shall not apply to commissioned officers of the United States Army and Navy and Marine Hospital services.

SEC. 18. Any itinerant vender of any drug, nostrum, ointment, or appliance of any kind intended for the treatment of disease or injury, or who shall, by writing or printing, or any other method, publicly profess to cure or treat diseases, injuries, or deformities, by any drug, nostrum, manipulation, or other expedient, shall pay to the State treasurer a special tax of $100 for each and every month.

SEC. 19. Any person practicing medicine, surgery, or obstetries in this State, without complying with provisions of this act, shall be punished by a fine of not less than fifty dollars nor more than five hundred dollars, or by imprisonment in the county jail for a period of not less than thirty days nor more than one year, or by both such fine and imprisonment, for each and every offense; and any person filing or attempting to file as his own the diploma or certificate of another, or a forged affidavit of identification, shall be guilty of a felony, and upon conviction shall be subject to such fine and imprisonment as are made and provided by the statutes of this State for the crime of forgery.

SEC. 20. The secretary of the State board of health shall receive a salary which shall be fixed by the board; he shall also receive his traveling and other expenses incurred in the performance of his official duties. The other members of the board shall receive no compensation other than their traveling and other expenses while employed on business of the board. The president and secretary of the board shall certify all bills ordered to be paid by the board. Such bills shall, on warrant of the auditor, be paid by the State treasurer.

SEC. 21. All sums of money received by the State board of health in payment for certificates of authority to practice medicine, and all fines and special taxes, collected through and by reason of this act, shall be paid into the State treasury.

SEC. 22. The sum of fifteen hundred dollars, or so much thereof as may be necessary, is hereby appropriated to pay the salary of the secretary, and to meet all the contingent expenses of the officers of the board, traveling and other expenditures of the members of the board in the performance of their duties, and shall not exceed the sum appropriated.

ABSTRACTS FROM CONSULAR REPORTS.

BERMUDA.—United States Consul C. M. Allen reports, under date of January 11, that the general health of the islands is good, but a fever of typhoid character prevails to some extent, and chiefly among the military. In the 99th regiment this fever is especially noted, and has assumed a more malignant type than among the civilians.

DUBLIN, IRELAND.—The official report for the week ending January 8 gives an annual death-rate of 29.8 per 1,000, for 16 of the principal towns. The lowest rate was 8.2, in Kilkenny, and the highest 60.1 in Waterford. In Dublin the rate was 31.7. No epidemic disease is reported from any part of the country.

FOOCHOW, CHINA.—The reports of United States Consul J. C. Wingate show that no epidemic or contagious disease has prevailed in this city during the month of December. The native city remains in its former unsanitary condition, but the foreign settlement is said to be well kept and healthy.

GASPÉ BASIN, QUEBEC.—Under date of January 26, United States Consul G. H. Holt reports this locality remarkably free from zymotic diseases until the past five weeks. During this time about 50 cases of scarlet fever have occurred, with 2 deaths. Nine deaths from diphtheria are also reported, out of 30 cases, on the shores of Gaspé Bay.

GUAYMAS, MEX.—Under date of December 31, United States Consul A. M. Ward reports that the general health of the city has been remarkably good, and a decrease in the infant mortality is especially observed during the past month.

LONDON, ENGLAND.—The report of the registrar-general for the week ending January 8 shows an average death-rate of 21.3 for 20 of the larger English towns, having an aggregate population of about seven and a half millions. The death-rate for the same week and for an equal population in the United States, was 23.5 per 1,000. But in making any comparison between the mortality of England and that of the United States, it is important to observe the effect of our vast range of climate, and the large proportion of colored population in our country. In England the conditions of race, climate, and occupation are more homogeneous than here, and under such circumstances a lower death-rate is to be expected.

Small-pox is noted as increasing in London, the deaths from that disease being 33 for the week. No deaths from typhus fever, and only 10 from typhoid fever are recorded.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports 181 deaths for the two weeks ending December 15; annual death-rate 30 per 1,000. Five deaths were caused by typhoid fever, 1 by typhus fever, and 4 by diphtheria. Mean temperature, 62°.

MOSCOW, RUSSIA.—United States Consul A. Weber sends a report for the month of October, showing a mortality of 1,602, in a population of 601,970; annual death-rate, 31.3 per 1,000; mean temperature, 34°. Among the causes of death noted there were 13 from small-pox; 81 from typhoid fever; 441 from diseases of the respiratory organs, and 147 from diarrhœal diseases.

NASSAU, BAHAMAS.—The reports of the United States consul, up to January 15, show that the town and vicinity are remarkably free from disease. About sixty American tourists and invalids have sought refuge there from the severe cold of our winter, and many of them have come from Florida, where the weather has been remarkably cold for that latitude.

NINGPO, CHINA.—The reports of United States Consul E. C. Lord, from November 20 to December 4, state that dysentery and typhoid fever had prevailed during the month, but the health of the city was improving with the advent of dry and cool weather. Mean temperature about 54°.

PANAMA.—United States Consul J. M. Wilson, under date of January 15, states that no reliable information can be obtained as to deaths and diseases. There were 10 deaths reported for the week, giving an annual death-rate of 43.5 per 1,000; no contagious diseases are noted, and malarial fevers are the prevailing diseases.

PARIS, FRANCE.—The United States consul forwards weekly bulletins, issued by Dr. Bertillon, the medical officer in charge of statistics. The latest reports are for the three weeks ending January 13. One of the principal subjects of notice is the increased mortality among infants, and especially from diseases of the digestive organs. Such increase does not belong to the season, and the cause is assigned to the increasing practice of confiding children to the care of hired nurses, and in more than half of such cases the parents make an express stipulation that the child shall not be fed from the breast. Dr. Bertillon regards this as being in effect infanticide, since the mortality observed is chiefly among the children so deprived of their natural food. The charts of the city given with each weekly bulletin exhibit the distribution of deaths from the principal zymotic diseases with great simplicity and clearness.

SANTIAGO DE CUBA.—This port is stated to be free from contagious diseases up to December 31. United States Consul J. C. Landreau says that the only cases of yellow fever that have occurred have been among the Spanish troops. Clean bills of health are issued.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic or contagious diseases up to December 27, 1880.

TUXPAN, MEX.—Dr. A. M. Boyd, under date of January 1, reports 32 deaths during the month of December. Among the causes noted are: consumption 1, bronchitis 1, pneumonia 5, diarrhœa 1, dysentery 2, malarial fevers 6, puerperal 1, and 3 from accidents. No contagious or epidemic disease has been observed during the year. Total number of deaths reported during the year, 281; annual death-rate, 39.1 per 1,000.

VIENNA, AUSTRIA.—United States Consul J. R. Weaver reports for the year 1880 that the civil population of the city was estimated at 707,532 by a special census taken in January of that year. The troops, numbering about 18,000, are not included. Deaths in the city during the year, 17,744, being at the annual rate of 24.5 per 1,000. Births reported, 28,610, of which 12,720 were illegitimate. Of still-births 1,342 are recorded. Among the causes of death noted are: consumption, 4,901; other lung diseases, 2,246; small-pox, 528; diphtheria, 456; scarlet fever, 174; typhoid fever, 171; whooping cough, 146; and measles, 102. The deaths under one year were 2,755, and from one to five years 528.

MISSISSIPPI RIVER INSPECTION.

The superintendent of the New Orleans *Anchor Line* writes as follows, in reply to a letter from Dr. R. M. Mitchell:

SAINT LOUIS, *November* 9, 1880.

SIR: Your letter of the 8th instant, asking my views on the subject for the purpose specified in your letter of October 28, as follows, has been received:

1st. Has the river inspection service of National Board of Health been of any advantage of benefit to the interests I represent, &c.?

2d. Is it desirable simply for business considerations aside from the the health question that the service be continued another year, &c.?

In reply I take pleasure in saying: 1st. All steamboat interests south of Saint Louis know that the confidence felt throughout the Mississippi Valley in the supervision and certificate system of the National Board of Health has been of signal benefit in preventing panic and local quarantine on several occasions during the past summer, which has been of immense benefit both to the steamboat interest as well as the shippers. 2d. I have no hesitation in asserting that we believe it to be the duty of the National Board of Health to continue its inspection service, not only next season but every season until the Mississippi Valley is no longer liable to the visitation of yellow fever. This assertion, I think, expresses the opinion of every steamboat manager of the Mississippi River.

Respectfully,

(Signed) JAMES O'NEAL,
Superintendent.

R. M. MITCHELL,
Director of Inspection Service,
National Board of Health, Memphis, Tenn.

ADULTERATION OF FOOD AND DRUGS.

At a regular meeting of the Chamber of Commerce of New York, held on Thursday, February 3, the president, Samuel D. Babcock, in the chair, the following resolutions, offered by Mr. Henry C. Meyer, and seconded by Mr. Daniel C. Robbins, were unanimously adopted:

Resolved, That this chamber approves the bill entitled "A bill to prevent the adulteration of food and drugs," which has recently been prepared by a committee of experts under the direction of the National Board of Trade, and which has received the indorsement of that body and been introduced in Congress.

Resolved, That this chamber respectfully urges upon Congress the early consideration of this important measure.

Resolved, That the secretary is hereby directed to send copies of these resolutions to the committees in Congress to whom this bill has been referred.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JANUARY 29, 1881.

Cities and States.	Total population, according to the United States census of 1880.	Total number of deaths. REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—The report for the month of December shows 26 deaths from small-pox. Dr. C. B. Combe forwards reports for October and November, stating that the deaths from small-pox were 11 in the first and only 4 in the second of those months. The increase in December seems to show a rapid spread of the disease during that month.

JACKSONVILLE, FLA.—Dr. A. W. Knight, health officer, sends a report of mortality for the last six months of 1880. The United States census of that year gives a population of 8,000, and the number of deaths being 116, the annual rate was 14.5 per 1,000. The white population is estimated at 5,000; number of deaths, 61; annual rate, 12.2. Colored population, 3,000; number of deaths, 55; annual rate, 18.3. Deducting 16 deaths of non-residents, the proper annual death-rate of the city is reduced to 12.5 per 1,000. The meteorological statistics are omitted here, in view of the full discussion of the climate of Florida, contributed by Dr. C. J. Kenworthy, and published in No. 30 of the BULLETIN. Among the principal causes of death noted during the six months were: consumption, 15; other lung diseases, 3; croup, 1; diarrhœal diseases, 16. Of the deaths from fever, 15 out of 17 were of ordinary malarial character, 3 from typhoid and 3 from typho-malarial fevers.

LYNCHBURG, VA.—Dr. Thos. L. Walker, president of the local board of health, forwards the following statistics for the year 1879: Deaths from all causes, 438; annual rate 20.9, as estimated at that time, when the population was supposed to be 21,000. By the census of 1880 the population was 15,960, and on that basis the death-rate for 1879 would be about 27.4 per 1,000. Deaths under 5 years, 182, or 41.6 per cent. of total mortality. As to races, the population was estimated at 10,000 white and 11,000 colored; it was therefore nearly equally divided, but the deaths were 136 white to 302 colored, showing at least twice as high a death-rate among the colored people as compared with the white.

NEW YORK CITY.—Dr. John T. Nagle, deputy registrar of records, presents a table showing the total number of still-births and deaths, with a statement of some of the principal causes of death during the seventy-five years ending December 31, 1880; also the number of births and marriages reported since 1847. The population of the city was estimated by the United States census at 33,131 in 1790, and at 1,206,577 in 1880. Some notable fluctuations are observed in the reported death-rate, which is placed at 44.4 per 1,000 for 1832, at 45.6 for 1849, at 42.5 for 1854, while the rate for other years seldom rises to 30, and was noted as low as 17.5 in 1814. The annual increase of population for the years intervening between the regular decennial census of the United States was estimated by taking one-tenth of the total increase of the city for the ten years and adding that number for each year. In 1875 the figures of the State census were used, and the population of the city was then estimated at 1,041,886.

PEORIA, ILL.—Dr. J. N. Niglas, health officer, sends a report for the year 1880, showing a total of 514 deaths. The population being 29,315 (by United States census), the death-rate was 17.5 per 1,000. Among the causes of death were: typhus fever 2, typhoid 22, typho-malarial 3, malarial 7, scarlet fever 60, diphtheria 40, measles 6, whooping cough 9, erysipelas 2, diseases of the brain and nervous system 48, of the heart 16, diarrhœal diseases 48, consumption 57, other lung diseases 21, puerperal 6, accidents 25. There were 18 still-births, which should not be included in the total of deaths; deducting these, the death-rate was 16.9 per 1,000. The number of births recorded was 674, of which only 5 were colored; annual birth-rate 22.8 per 1,000. The highest number of deaths per month was 55, in November; the lowest 32, in March. It is also noted that of the 514 interments, 39 were of bodies sent to the city for burial; deducting these and the 18 still-births, the proper mortality of the city is reduced to 457, and the death-rate to 15.6 per 1,000

SALEM, FAUQUIER COUNTY, VA.—Under date of January 26, Dr. F. Horner, jr., reports three fatal cases of diphtheria in the family of a clergyman. A fourth child was convalescent, with complete loss of power in the lower limbs. In the fatal cases there was gangrene of the tissues in the pharynx, with copious discharge from the nasal passages. Various treatment was tried, without any benefit. In these cases, the origin was clearly traced to contagion from a negro child which had at first been supposed to be affected with simple inflammation of the throat.

. SAN ANTONIO, TEX.—Dr. R. Menger, city physician, reports, under date of January 26, that measles have been introduced from New Orleans; only one case had proved fatal. Most of the colored people and Mexicans had either had small-pox or had been vaccinated, so that the disease had not spread among the citizens. Some deaths from consumption had occurred among visitors already affected with that disease; but the general health of the city is good.

WEBSTER, MASS.—Dr. F. A. Bosworth, under date of January 30, states that this town has a population of 5,684, according to the census of 1880. Burial permits are required, and forms are supplied for registration, which are said to be faithfully filled by those required by law to do so.

A communication from New Orleans, dated January 24, contains the following information:

An important meeting of the New Orleans Medical and Surgical Association was held last night, Dr. Davidson presiding, and Dr. M. Levy, secretary. There were present representatives of the Chamber of Commerce, Auxiliary Sanitary Association, State board of health, the several railroads, and some of the steamship companies.

These gentlemen had been invited to participate in the discussion of a report on the subject of quarantine.

The committee appointed by the Medical and Surgical Association to make suggestions with regard to quarantine submitted a report,

of which the principal features are as follows: The committee is of opinion that "the responsibility of keeping infectious diseases entirely out of the Mississippi River should devolve upon the national government, as being the only power capable of exercising such supervision as would be satisfactory to all interested communities."

The committee suggest: First. That quarantine shall consist of the detention, for purposes of disinfection, fumigation, and purification, of all vessels from ports in which yellow fever usually prevails, or from ports where other contagious or infectious diseases are reported to exist.

SEC. 2. All vessels from infected ports shall be detained at quarantine station for purposes specified above, for such length of time as the proper authorities may determine.

SEC. 3. In case any contagious disease prevails as an epidemic at the port from which the vessel sailed, or has touched during the voyage, or on any vessel with which she has come in contact, the detention at quarantine shall not be less than five days from date of exposure.

SEC. 4. Free *pratique* to be allowed to vessels which have not sailed from infected places.

Section 5 defines what is meant by an "infected" vessel and infected persons.

Section 6 describes the arrangement of merchandise into three classes for sanitary purposes.

Section 7 recommends the appointment of an inspector of the National Board of Health at Eadsport, to prohibit the entrance into the Mississippi of dangerously-infected vessels, and to order the same to Ship Island quarantine.

Section 8 advises that a resident representative of the National Board be allowed access to the meetings and records of the local board in an advisory capacity.

Section 9 provides that when a case of yellow fever shall occur a board of experts be appointed, composed of the resident member of the National Board, the president of the local board, and a local practitioner, said physician to be appointed by the National Board. A majority report from the experts shall be binding, and no dissenting opinion shall be published. Their final decision shall at once be reported to the National Board in cipher.

The report is signed by D. C. Holliday, M. D.; J. P. Davidson, M. D.; John del Orto, M. D.; Samuel Logan, M. D.; Thomas Layton, M. D.; F. Loeber, M. D.

Sections 1, 2, 3, and 4 were adopted without opposition. Natives of places where yellow fever is epidemic were excluded from the effect of section 5.

There was considerable discussion on section 6.

Among the railroad representatives a resolution was adopted authorizing the appointment of a committee of five to confer with the railroad managers and form a schedule of articles of merchandise subject to quarantine.

Sections 7 and 8 were opposed by Mr. Booth, of the State board, and Dr. Tebault had objections to section 9. The entire report was, however, unanimously adopted. Copies of it will be sent to members of Congress, and printed for general distribution.

The following reports for the week ending January 29, 1881, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 5; under 5 years, 2; consumption 1, croup 1, pneumonia 1. Allegheny, Pa., 75,000; deaths, 31; under 5 years, 13; consumption 3, diphtheria 3, scarlet fever 3, congestion of lungs 1, bronchitis 2, measles 2. Bath, Me., 8,000; death, 1; under 5 years, 1. Belfast, Me., 5,30?; deaths, 3; under 5 years, 1; consumption 1. Brattleborough, Vt., 6,000; death, 1; gastric fever 1. Calais, Me., 6,162; death, 1. Carrollton, Miss., 600; no deaths. SAPELO QUARANTINE STATION.

At a meeting of the city council of Savannah, Ga., held February 3, 1881, the following communication was read:

OFFICE BOARD SANITARY COMMISSIONERS,
Savannah, January 31, 1881.

To the honorable Mayor and Aldermen, city of Savannah, Ga.:

GENTLEMEN: I have the honor to transmit the following resolution, which was passed at the regular meeting of the board held this day:

Resolved, That the board of sanitary commissioners of Savannah do reaffirm their previous action indorsing the National Maritime Quarantine, located on Black Beard Island, and known as the Sapelo Quarantine Station, and respectfully recommend to the city council to urge upon our Senators and Representatives in Congress the early appropriation of such sum as may be necessary for the erection of proper buildings, and the complete equipment of said station.

Your obedient servant,

J. T. McFARLAND,
Secretary of the Board of Sanitary Commissioners and Health Officer.

The resolution was adopted and the mayor requested to communicate the action of council to our Senators and Representatives in Congress.

The following resolutions presented at the eighth annual meeting of the American Public Health Association at New Orleans, December 10, 1880, by Dr. D. W. Hand, of Minnesota, are communicated by Dr. Azel Ames, secretary of the American Public Health Association.

Resolved, That the contagiousness of diphtheria is now well established; that that disease should, in all cases, be treated with the same rigorous isolation and quarantine that is everywhere enforced against small-pox.

Resolved, That as we know little or nothing of the origin of diphtheria, we will request the National Board of Health to continue its investigation of this disease.

—

Investigations upon the matter above referred to have been made and are still in progress, under the charge of Drs. H. C. Wood and H. F. Formad.

Dr. J. L. Carter, health officer of Dallas, Tex., in a communication of February 3, 1881, states that in Dallas and its suburbs some cases of cerebro-spinal meningitis have occurred; that 8 deaths had occurred, one of them in the hospital. Two weeks have elapsed since the first case. Some cases apparently yield to treatment, and some cases are very mild."

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, FEBRUARY 19, 1881. [No. 34.

MONTHLY REVIEW FOR JANUARY, 1881.

During this month several cities of Massachusetts have been added to the table of weekly reports, but the irregularity of some larger cities has reduced the mean population for the four weeks ending January 29 to 7,555,290, being 71,815 less than that for December. The cold weather, which began in the latter part of last month, continuing in January, has raised the general death-rate from 20.81 to 23.35. But the rate of mortality under 5 years has fallen from 7.70 to 7.62 per 1,000, owing to a decrease in the deaths from diphtheria and croup. A comparison of this month with December shows no very marked changes in the several diseases noted in the following table:

TABLE OF PRINCIPAL CAUSES OF DEATH.

Week ending—	Population.	Total deaths.	Annual rate per 1,000.	Deaths under 5 years.	Annual rate per 1,000.	Per cent. of deaths.	Consumption and lung diseases.			Consumption.			Lung diseases, acute.			Diphtheria and croup.			Diphtheria.

Causes of death.—Both consumption and lung diseases show a small increase of mortality, especially in the Northwest, where the cold was most severe, and in the Southeast, where the people were least prepared for it. Diphtheria and croup, as observed above, decreased rapidly with the cold weather, and scarlet fever shows a rise of only 7 per cent. Diarrhœal diseases and whooping-cough remain nearly stationary, while enteric and malarial fevers have been reduced 7 and 5 per cent., respectively, since last month. The general increase of small-pox, noted last month, still continues, and 262 deaths are reported for January, against 227 in December. In January the reports were as follows: New York, 30 deaths; Hudson County, N. J., 3; Camden, N. J., 7; Philadelphia, 196; Wilmington, Del., 3; Chicago, 17; and San Francisco, 6. The correspondence from Texas, and the consular reports from Matamoras, Mexico, also show that Brownsville, Texas, and the country along the Rio Grande has been extensively infected from the Mexican frontier, where no effective measures are employed to suppress the disease or to prevent contagion.

The relative mortality of the white and colored cannot be given with any accuracy until the late census shall furnish the respective populations for a sufficient number of cities. The reports of 1879 and 1880 indicate, however, that the mean annual death-rate of the whole white population is not above 20 per 1,000, while that of the colored people is above 30. The ratio of two to three will nearly express the relative mortality, so far as it has been determined by reports based on an imperfect estimate of population.

Distribution of diseases.—In the Northeast section the most marked changes since December are the reduction of deaths from malarial fevers from 0.20 to 0.13 per 1,000, and of enteric fever from 0.40 to 0.33. Diphtheria and croup have each fallen 10 per cent., but measles are increasing, though still giving only 0.16 deaths per 1,000 per annum.

In the Southeast the fall of scarlet fever from a rate of 0.57 to 0.47 per 1,000 is chiefly due to the absence of two reports from Baltimore, which city furnishes most of the deaths from this disease and from diphtheria in the Southeast section. Enteric and malarial fevers and whooping-cough are decreasing; diphtheria and croup also show a reduction of 30 per cent. each.

The Northwest section exhibits the same general decline in deaths from the zymotic diseases. The mortality from acute lung diseases has increased 14 per cent., as compared with 31 per cent. for the Southeast, while it has remained unchanged in the Northeast section.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

Whereas the presence of yellow fever at Vera Cruz, Mexico; Rio de Janeiro, Brazil; Havana, Cuba; island of St. Thomas and other tropical ports, renders it liable by importation to our principal seaport, New Orleans:

Therefore, be it ordained by the mayor and aldermen of the city of Vicksburg, Miss., that from and after the fifteenth day of May next, no steamboat or other water-craft coming from below will be permitted to land at Vicksburg, discharge freight or put off passengers, unless said boat shall have a certificate from a sanitary inspector of the National Board of Health that he has complied with the inspection rules and regulations of said board.

VICKSBURG, MISS., *February* 12, 1881.

At a regular meeting of the board of mayor and aldermen held on the evening of February 7 the following resolution was adopted, to wit:

Resolved, That the National Board of Health is hereby earnestly requested to put in operation the inspection of steamboats and other water-crafts between this city and the city of New Orleans by the fifteenth day of May next, and that a copy of the above ordinance and resolution be forwarded to the National Board of Health at Washington, D. C., for their action.

T. J. BIRCHETT, *Mayor*.

QUARANTINE REPORTS.

SHIP ISLAND STATION.—Dr. S. H. Collins, inspector, forwards weekly reports from November 27 to January 1. The arrivals were 7 during that period: 6 barks and 1 brigantine. None of the vessels were detained, as no disease was found.

NOTICE.

The attention of health officers and others who fill the weekly reports of mortality in cities of the United States, is especially invited to the change of form in the cards, and in the table compiled from them. In the column for the number of deaths, white and colored, those places only will hereafter be noted whose reports are definitely known to separate the diseases and the deaths of the two races, and which can furnish the respective populations. All populations not agreeing with those previously given have been changed in accordance with the figures furnished by the Census Bureau, and remain subject to correction from that office.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

MORTALITY IN CITIES AND TOWNS OF THE UNITED STATES FOR THE YEAR 1880.

NOTE.—The above table is compiled from weekly reports to the National Board of Health, for the 52 weeks from January 3, 1880 to January 1, 1881. The figures will, therefore, differ from those of annual reports of cities, made out for the 12 calendar months. The populations used in the table are those given by the tenth United States census, so far as they have been furnished.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING FEBRUARY 5, 1881.

ABSTRACTS FROM CONSULAR REPORTS.

ANTWERP, BELGIUM.—United States Consul J. H. Stewart forwards the official report of mortality for the year 1880. He observes that small-pox has prevailed more or less throughout the year. The disease was confined to a part of the city which did not affect the shipping, and clean bills of health were issued to all vessels clearing for ports in the United States. The sanitary condition is remarkably good, considering the mobile character of the population and the deficiency of hospital accommodation for sick seamen.

APIA, SAMOAN ISLANDS.—United States Consul T. M. Dawson sends a report covering the period from October 13 to November 10, 1880. No estimate of population is given, and the only deaths reported are those of the editor of the Samoa Times, and of King Malietoa, both from consumption. A shock of earthquake occurred November 9. No record of deaths can be obtained, but the islands are regarded as very healthy.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports, for the month of December, 70 deaths in a population of 20,000; annual death-rate, 40.9 per 1,000. No contagious or epidemic disease is reported, and the above death-rate is not there regarded as excessive, since the general sanitary condition is considered good. Mean temperature, 8.°.

CONSTANTINOPLE.—United States Consul G. H. Heap, under date of January 13, observes that the general health of Turkey is better than usual, no epidemic disease prevailing at present. There is still some disease among cattle, in a few provinces, but epizootic disease seems to be decreasing.

GIBRALTAR, SPAIN.—A report is forwarded by the United States consul giving the annual mortality from fevers in the civil population from January 1, 1873, to August, 1880. The deaths, beginning with 1873, were: 455, 457, 404, 448, 508, 470, and 419 in 1879. No estimate of population for those years is given.

GUAYMAS, MEXICO.—United States Consul A. Willard reports only 6 deaths for the month of December in a population of 5,500, of which but one death was under 5 years. Annual death rate, 11 per 1,000.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webster reports 48 deaths in November, of which only 2 were from contagious diseases. Population, 27,500; annual death rate, 21.2 per 1,000; sanitary condition good.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton forwards a report of mortality for 13 weeks, ending January 28. He states that small-pox was prevailing in August, and became epidemic in October. Since October 30 there have been 177 deaths from variola, and estimating the mortality at 10 per cent. of the cases, about 1,770 persons have been attacked. At the close of January it is supposed that there are about 300 cases in the city, and that sufficient material still remains to keep the disease up to this rate for the rest of the year. A committee has been appointed to furnish free orders for medicines and food to the poor, but while this may relieve some suffering, the epidemic can only be checked by compulsory vaccination, which is not likely to be enforced. The consul renews his recommendations as to restrictions on the exportation of rags, and observes that the whole neighboring Texas border is becoming infected from Mexico.

The report of mortality from October 30 to January 28 shows a total of 279 deaths, of which 177, or 63.5 per cent., were from small-pox. Of these, 139 were under 10 years of age, 20 between 10 and 15, and 18 over 15 years.

MAZATLAN, MEXICO.—United States Consul E. G. Kelton reports for the month of December 73 deaths, in a population of 14,000; annual death-rate, 61.4 per 1,000. Mean temperature, 72°. No contagious disease is reported.

MELBOURNE, AUSTRALIA.—The report of United States Consul O. M. Spencer for the month of October shows a total mortality of 38 in the city and suburbs having a population of 265,000; annual death-rate, 19 per 1,000. Five deaths were from typhoid fever and 31 from other diseases not specified. Mean temperature, 54°.3. Consumption is noted as one of the principal causes of death.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports, under date of January 29, that quarantine against Key West had been removed. There was no foundation for reports of yellow fever in Nassau, circulated by persons in Florida interested in preventing the departure of invalids and tourists for the island.

NEW ZEALAND.—The reports for the month of November give a total of 127 deaths in a population of 128,225; annual rate, 11.7 per 1,000. Births during the same month, 453; annual rate, 41.7 per 1,000. No epidemic disease is reported.

PANAMA, UNITED STATES OF COLOMBIA.—Under date of January 25, United States Consul J. Wilson reports 15 cases and 4 deaths for the preceding week, from "Panama fever". Five cases of yellow fever and one death are reported from the native hospital; but there is a difference of opinion among the physicians as to the nature of the disease, some regarding it as "bilious remittent" and others as a mild type of yellow fever.

PORTO RICO.—United States Consul E. Conroy reports, for the month of December, 84 deaths in a population of 23,240; annual death-rate, 45.1 per 1,000. Of yellow fever, 16 cases and 9 deaths are reported; of small-pox, 60 cases and 14 deaths; of typhoid fever, 3 cases and 1 death. The authorities are very reticent as to giving information concerning the sanitary condition of the province.

SABANILLA, UNITED STATES OF COLOMBIA.—United States Consul

W. Randall reports only 31 deaths for the three months ending December 31. Of these, one was from yellow fever, one from small-pox, and two from malarial fevers. The cases of fever did not originate in the port of Baranquilla, which is one of the healthiest places in South America, and safe to enter at all seasons.

SAGUA LA GRANDE, CUBA.—United States Commercial Agent J. F. Swords reports, under date of February 2, that 14 cases of small-pox had occurred in the city, but no deaths up to that date. In the harbor, distant 14 miles from the city, there was no sickness. No increase of small-pox is anticipated, as vigorous measures have been adopted to suppress the disease.

SYDNEY, AUSTRALIA.—During the month of October 736 births were recorded, and 557 deaths. Annual birth-rate, 63.5 per 1,000; annual death-rate, 48. Among the causes of death were: Measles, 61; whooping-cough, 20; typhoid fever, 11; consumption, 15; other lung diseases, 62. There were 211 deaths under 5 years, or nearly 38 per cent. of the total mortality.

VANCOUVER'S ISLAND.—In the absence of weekly reports, United States Consul A. Francis forwards a report for the four weeks ending January 22. There were 6 deaths, giving an annual death-rate of 14.4 per 1,000. Two deaths were from consumption and one from pneumonia. Mean temperature, 48°.

VERA CRUZ, MEXICO.—The reports of United States Consul S. T. Trowbridge for the 3 weeks ending January 23 show that 22 deaths from yellow fever have occurred within that period, and 5 deaths from small-pox. The week ending January 9 is noted as the coldest weather known in that place for many years, the mean temperature being 66°.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—Dr. C. B. Combe reports for the month of January 51 deaths, of which small-pox caused 33; consumption, 3; old age, 3; convulsions, 4; malarial fever, 1; there has been no decrease in small-pox since December.

Taking the population at 5,800, the annual death-rate for January was 103.5 per 1,000, of which nearly two-thirds was due to variola. The mortality from other diseases was also high, on account of the unusual cold, and consequent suffering among the poorer classes, who were not prepared to protect themselves against its effects.

HAVANA, CUBA.—For the week ending February 5, no deaths from yellow fever are reported, but a few cases still exist in some districts which are constantly more or less infected. Small-pox shows some increase, and 21 deaths are reported for the week.

MACON, GA.—Dr. J. R. Duggan, secretary of the Macon Medical Society, states, under date of February 11, that the city has a board of health, but that no physician is a member of it. Dr. Duggan will furnish weekly reports of mortality, and his name is placed on the list of correspondents of the National Board of Health.

The following reports for the week ending February 5, 1881, are from places in which burial permits are not required:

Alexandria, Va., 13,000; deaths, 5, accident 1, old age 1. Allegheny, Pa., 78,000; deaths, 30; under 5 years, 12; consumption 2, diphtheria 5, typhoid 1, scarlet fever 5, pneumonia 5, bronchitis 1, puerperal 1. Bath, Me., 8,000; death, 1; consumption 1. Belfast, Me., 5,308; deaths, 2; under 5 years, 1; consumption 1, typhoid fever 1. Brattleborough, Vt., 6,000; deaths, 2; under 5 years, 1; erysipelas 1. Calais, Me., 6,162; deaths, 3; under 5 years, 1. Carrollton, Miss., 600; death, 1. Chillicothe, Ohio, 11,000; deaths, 8; under 5 years, 1; accident 1, consumption 2, erysipelas 1, scarlet fever 1. Circleville, Ohio, 5,936; deaths, 2; under five years, 1; consumption 1, pneumonia 1. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 2; under 5 years, 1; consumption 1. Corinth, Miss., 2,264; death, 1. Crystal Springs, Miss., 955; no deaths. Dallas, Tex., 10,327; deaths, 8; under 5 years, 1; cerebro-spinal meningitis 1, croup 1, malarial fever 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Gunn City, Mo., 125; no deaths. Hernando, Miss., 1,000; deaths 2; accident 1, pneumonia, 1. Huntingdon, Pa., 1,500; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; no deaths. Kenosha, Wis., 5,500; deaths, 2; consumption 1. La Salle, Ill., 8,885; death, 1; consumption 1. Louisiana, Mo., 5,200; death, 1; consumption 1. Madison, Ind., 9,009; deaths, 4; under 5 years, 1. Marquette, Mich., 1,000; deaths, 2; consumption 1, typhoid fever 1. Martinsburg, W. Va., 6,384; deaths, 10; accident 1, consumption 3, puerperal 1. Meridian, Miss., 4,013; deaths, 2; consumption 1, bronchitis 1. Milledgeville, Ga., 3,000; no deaths. Monmouth, Ill., 6,000; deaths, 4; under 5 years, 2; accident 1, consumption 1, pneumonia 1. Mount Pleasant, Iowa, 1,500; death, 1; under 5 years, 1. Muscatine, Iowa, 8,412; deaths, 3; consumption 2. Muskegon, Mich., 11,300; deaths, 4; diarrhœa 1, diphtheria 2. Nebraska City, 5,000; death 1; under 5 years, 1; croup 1. Niles, Mich., 4,200; deaths, 2; bronchitis 2. Okolona, Miss., 2,000; deaths, 3; consumption 1. Painesville, Ohio, 5,504; death, 1. Pass Christian, Miss., 2,000; no deaths. Phœnixville, Pa., 6,692; death, 1. Port Gibson, Miss., 1,200; death, 1. Port Royal, S. C., 750; death, 1; accident 1. Raymond, Miss., 1,500; no deaths. Rensselaer, Ind., 900; no deaths. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; death, 1; typhoid fever 1. Winchester, Va., 5,000; deaths, 2; pneumonia 1. Winona, Minn., 10,000; deaths, 2; under 5 years, 1; consumption 1. puerperal 1. Youngstown, Ohio, 15,089; deaths, 3; under 5 years, 1; consumption 1, typhoid 1, pneumonia 1. Total population, 318,236; deaths under 5 years, 29; total number of deaths, 116; annual rate per 1,000, 16.0.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, FEBRUARY 26, 1881. [No. 35.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—The United States consul at Matamoros, Mexico, Mr. W. P. Sutton, and Dr. C. B. Combe, inspector on the Texas side, having urged the importance of measures to prevent the spread of small-pox on the United States border, the National Board of Health requested the Surgeon-General of the Army to institute an inquiry into the origin of the disease at Brownsville, Tex. With this object, Surgeon J. C. G. Happersett, U. S. A., post surgeon at Fort Brown, was directed to investigate the subject, and under date of January 13 he makes the following report to the medical director of the Department of Texas:

In relation to the epidemic of small-pox now prevailing here, I have the honor to state that the disease, so far as Brownsville and its immediate vicinity are concerned, is abating. On Sunday, January 9, but 46 cases existed within the city limits.

It must be remembered, however, that the diminution in the number of cases is probably owing to the exhaustion of unprotected material rather than to the influence of any hygienic measures, other than vaccination, which have been urged upon the municipal authorities.

The ordinance authorizing compulsory vaccination was really a dead letter until within ten days (now being carried out), and it seems impossible to either isolate the cases, or to destroy the local points of infection, by proper fumigation.

For the history of the disease in Brownsville Dr. Happersett refers to the following note, accompanying his report for the month of December:

Small-pox made its appearance in Brownsville, Tex., about the middle of the month of September, 1880, introduced from Matamoros, Mexico, where it was then prevailing in epidemic form. The first case was that of a Mexican woman who had been employed to nurse a child sick with small-pox in Matamoros. The child died, and the woman returned to Brownsville, being at the time covered with the eruption. She was visited by all of her friends and neighbors for some weeks, and finally recovered. This was during the latter part of August and early part of September, and from this case has arisen the epidemic which has proved so fatal. The disease spread slowly until the middle of November, but so indifferent were the residents of the place to the presence of the disease that no effort was made to prevent cases, even in the desquamating stage, from traveling about publicly. Large processions paraded the streets as escort to the public funerals from the crowded churches.

In the latter part of November so many cases were known to exist that even the Mexican population showed some alarm.

An order from headquarters of the post, prohibiting all intercourse between Fort Brown and Brownsville, was followed by a meeting of the town council and health officials. Several of the physicians attended the meeting and urged the necessity for prompt and energetic action. The measures urged were vaccination, isolation, and fumigation.

From the known opposition of the Mexicans to the former it was made obligatory, under penalty of fine, if found unvaccinated after six days. This, as well as the other measures, was little better than a dead letter. I am informed by the health officer that about 300 have been vaccinated; nor has there been a single arrest for violation of any of the ordinances approved at that meeting.

Probably owing to the exceptional cold of the present season, the mortality among the Mexicans has been very great.

The examinations made by the policemen detailed for the purpose have been so carelessly done that I place no dependence upon the returns.

The following data I copy from the record of the health officer: Population, 5,800; number of cases, 280; number of deaths, 50; number of cases at present, 80.

The garrison was carefully examined, and as soon as reliable vaccine matter could be obtained every man, woman, and child not presenting undoubted evidence of having been recently successfully vaccinated was vaccinated.

But two cases of the disease have so far appeared in the garrison. Of these, one presented no evidence of vaccination; the other had been vaccinated, and his attack is the mildest form of varioloid.

It is claimed that small-pox always prevails here. However true this may be of Matamoros, it certainly is not so of Brownsville, for, as that report shows, the first case occurring here is well known, and the spread of the disease clearly traced from that case.

There can be no doubt that the handling and shipment of rags, as mentioned by the United States consul at Matamoros, is attended by great danger, and, in my opinion, should be prevented, unless after complete disinfection.

This article of export comes not alone from Matamoros, but rags, wool, and hides are collected from both sides of the Rio Grande, as far, at least, as Rio Grande City (Fort Ringgold, where the disease in virulent form is now prevailing), and brought by steamboats to this place.

In this connection, however, I desire to state that I have conversed with the largest house engaged in this business, either here or in Matamoros, and am informed that no rags have been purchased or packed since the month of August, 1880.

The last shipment was by the railroad in the same month, but the vessel on which this lot was shipped stranded inside the bar, and the load was transferred to the schooner Flora Woodhouse, which vessel sailed from the port of Brazos Santiago January 5, 1881.

No case of small-pox has occurred among the employés of either the packing, shipping, or transporting parties.

This, however, does not prove that it is not a source of great danger, and especially will be so after an epidemic so widespread as the present.

It is very difficult to get reliable information in regard to the city of Matamoros.

The Mexicans are opposed to vaccination, as well as every other method known for the prevention of this or other contagious disease, believing such to be the will of God; but the evidence is that the disease is on the increase, or at least not abating, and from the known filthy condition of the town, and total lack of precautionary

measures by the public authorities, it is not reasonable to suppose there can or will be any abatement so long as there is ready material.

The exceptional cold of the winter in this latitude has added greatly to the fatality of the epidemic, and I am informed by the local physicians that death frequently occurs from congestion of lungs, owing to lack of proper clothing.

Hemorrhagic cases are specially frequent, and of course fatal.

The disease has so far been confined principally to the poorer classes, those poorly fed, clad, and housed, living in filth, in which the towns of Brownsville and Matamoros abound, but an occasional case among the whites, or better class of Mexican population, shows only too well that no class of citizens will be exempted.

Very respectfully, your obedient servant,

J. C. G. HAPPERSETT,
Surgeon, U. S. Army, Post Surgeon.

FORT CUSTER, MONT.—Dr. J. C. Merrill, U. S. A., reports, under date of January 17, an epidemic of scarlet fever at the post. The first case, the child of a laundress, was taken November 14; since that time there have been 9 cases among children of soldiers and 10 among those of the officers. Of these cases 2 were fatal. No case occurred among adults till January 13, when a corporal went to hospital with the disease, and three other men followed on the 17th; all four are convalescent. The origin of the disease is ascribed to the presence of some Crow Indians, as they had suffered greatly from scarlet fever for some time before their arrival, and their blankets and buffalo robes make the most retentive *fomites* for any poison.

HAVANA, CUBA.—During the week ending February 11, only 2 deaths from yellow fever are reported, one of them being a soldier and one a citizen. There were 19 deaths from small-pox in the same period.

TRENTON, N. J.—Dr. E. M. Hunt, secretary of the State board of health of New Jersey, under date of January 22, 1881, writes as follows:

There have been 4 cases of small-pox in Trenton. The normal school had one case, and so suspended. Vaccination is thoroughly followed up. Sporadic cases have occurred in various places in the State. The report of cases in the Beverly school was unfounded.

NOTICE.—The attention of health officers and others who fill the weekly reports of mortality in cities of the United States, is especially invited to the change of form in the cards, and in the table compiled from them. In the column for the number of deaths, white and colored, those places only will hereafter be noted whose reports are definitely known to separate the diseases and the deaths of the two races, and which can furnish the respective populations. All populations not agreeing with those previously given have been changed in accordance with the figures furnished by the Census Bureau, and remain subject to correction from that office.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

ABSTRACTS FROM CONSULAR REPORTS.

ALGIERS, AFRICA.—United States Commercial Agent A. Jourdan, under date of January 7, reports 82 deaths for the week. Among the causes noted were: Consumption 8, other lung diseases 26, croup 4, measles 2, typhoid fever 4, and diarrhœal diseases 5. The annual death-rate was 61.7 per 1,000.

AMOY, CHINA.—Reports to December 25 show that this city remains in its usual unsanitary condition, but no epidemic disease is reported.

CADIZ, SPAIN.—United States Consul B. G. Haynes, under date of January 20, informs the Surgeon-General of the United States Marine Hospital Service that on account of yellow fever having appeared in Senegal, Africa, all vessels sailing from that port after December 23 have been declared foul; and, also, all vessels sailing from Key West, Fla., after December 10, for the same reason.

DUBLIN, IRELAND.—During the three months ending January 1, 1881, there were 2,206 births registered in a population of 314,666; annual rate 28 per 1,000. During the same period 2,561 deaths were reported, giving an annual rate of 32.6 per 1,000. This rate is, however, reduced to 31.8 by omitting 64 deaths of persons brought into public institutions from outside the district. Sixteen of the principal towns of Ireland show the lowest death-rate of 15.6 in Newry, and the highest, 43.8, in Waterford; in the latter city measles caused 42 deaths, and in Cork 39. Small-pox is reported only in Dublin, where 14 deaths occurred.

FOOCHOW, CHINA.—United States Consul J. C. Wingate reports, December 18, that the native city continues in its usual filthy condition. The foreign settlement is well kept, and the health of the residents generally good. Mean temperature, 58°.

GHENT, BELGIUM.—United States Consul A. Lefebvre reports for the month of December 292 deaths, in a population of 130,670; annual death-rate 26.3 per 1,000. Causes of death, small-pox 1, typhoid fever 6, scarlet fever 7, and diphtheria 5, consumption 33, other lung diseases 64; diarrhœa prevalent, but deaths not given. Much snow and frost of late.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett reports for the two weeks ending January 16, a total of 28 deaths in Pointe à Pitre; annual death-rate 31.9 per 1,000. Causes of death not stated, but malarial fevers are most prevalent.

The Official Gazette of December 17 gives in four pages the order of December 12, regulating quarantine and sanitation.

LYONS, FRANCE.—United States Consul B. F. Peixotto, in his report of January 15, states that the mortality of this city had been increased from 24.6 to 28.4 per 1,000 by the cold weather lately prevailing. Ten deaths from small-pox are recorded for the week ending January 15, and measles, scarlet fever, and whooping-cough are prevailing. The general sanitary condition of the city is not commensurate with its importance and business, most of the numerous working people being very poorly housed.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton reports 12 deaths from small-pox out of 20 from all causes, during the week ending February 5. Annual death-rate 65.2 per 1,000. There are supposed to be about 300 cases in the town.

MESSINA, ITALY.—United States Consul G. H. Owen sends a report including the months of June, July, August, and September, 1880. There were 779 deaths in the 4 months in a population of 122,220, giving an annual death-rate of 19.1 per 1,000. Typhoid fever caused 30 deaths, and other infectious diseases 44; among the latter, diphtheria was the most prevalent. General sanitary condition, good.

NEWCASTLE-UPON-TYNE, ENGLAND.—The report for the last three months of 1880 gives a total of 776 deaths, representing an annual rate of 20.8 per 1,000. The births registered were 1,273; annual rate 34 per 1,000. Deaths under 5 years, 327. Some of the principal causes of death were measles 6, scarlet fever 33, diphtheria 1, whooping-cough 13, enteric fever 12, diarrhœa 23. Diseases of respiratory organs 128, not specified as to classes.

NINGPO, CHINA.—United States Consul E. C. Lord reports this city in a fair condition, and no epidemic disease prevailed up to January 1.

Reports for the five weeks ending January 8, observes that typhoid fever has lately been quite frequent in this district, but no estimate of mortality can be given.

RIO DE JANEIRO, BRAZIL.—United States Consul Thomas Adamson reports for the two weeks ending January 22 17 deaths from yellow fever, 7 from small-pox, 6 from typhoid fever, 14 from "pernicious" fever, and 78 from consumption. Total deaths, 408; annual death-rate, 33.2 per 1,000. The British bark *Campanero* cleared for Baltimore January 24; the captain refused to take a bill of health from the United States consulate. The sailing of the vessel being

then delayed by the illness of the mate, it is presumed that her sanitary condition would not bear inspection, and hence the refusal to apply for a bill of health.

ST. HELENA.—In his report of January 22, United States Consul H. J. Crouch observes that during the previous week the only death reported was that of a Spanish sailor, who died of "Java fever"; no deaths in the city of Jamestown, which has a population of 6,240. The streets are cleaned and swept daily, and the excellent sanitary condition, with the favorable climate, renders this one of the most salubrious places in the world.

ST. IAGO DE CUBA.—United States Consul J. C. Landreau reports for the month of January, yellow fever 34 cases and 20 deaths; small-pox 7 cases, all fatal; typhoid fever, 10 cases and 7 deaths. Total deaths, 133; population, 40,000; annual rate, 38.8 per 1,000. The cases of yellow fever were mostly among the Spanish troops, and the port and shipping remaining free from contagious diseases, clean bills of health are issued.

ST. THOMAS, WEST INDIES.—United States Consul Victor Thompson sends weekly reports showing that small-pox has been increasing during the month of January; only one death was reported from January 1 to 15, while 13 occurred in the two weeks following. The disease is said to have been brought from Porto Rico.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic or contagious diseases up to January 3.

Later advices report this district free from contagious and epidemic disease up to January 10.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge, in his report for the week ending January 30, notes 4 deaths from yellow fever, and 2 from small-pox. Total deaths, 30; annual death-rate, 78.2 per 1,000.

QUARANTINE STATION, CHARLESTON, S. C.—Dr. R. Lebby reports that the American schooner *Elizabeth McCook* arrived at quarantine February 1 with five men, out of a crew of eight, sick with malarial fever. The vessel was 15 days from Port de Paix, and bound for New York. The sick were transferred to Dr. Irving, United States Marine Hospital, and the vessel discharged from quarantine.

The following reports for the week ending February 12, 1881, are from places which do not require burial permits:

Alexandria, Va., 13,000; deaths, 9; under 5 years, 5; consumption 3, pneumonia 4, bronchitis 1. Allegheny, Pa., 78,000; deaths, 22; under 5 years, 13; accident 1, consumption 3, diphtheria 1, scarlet fever 2, pneumonia 4. Bath, Me., 5,000; deaths, 2; consumption 1. Belfast, Me., 5,308; deaths, 4; consumption 1, croup 2. Brattleborough, Vt., 6,000; death, 1. Bucyrus, Ohio, 3,950; deaths, 2; pneumonia 2. Calais, Me., 6,162; death, 1; under 5 years, 1. Chillicothe, Ohio, 11,000; deaths, 5; consumption 1, scarlet fever 1, puerperal 5. Circleville, Ohio, 6,000; death, 1; consumption 1. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 9; under 5 years, 4; consumption 3, scarlet fever 3, pneumonia 1. Corinth, Miss., 2,264; death, 1. Crystal Springs, Miss., 955; death, 1; old age 1. Decatur, Miss., 1,000; death, 1. Fayette, Miss., 400; no deaths. Helena, Mont., 3,630; death, 1; erysipelas 1. Hernando, Miss., 1,000; no deaths. Huntingdon, Pa., 4,500; deaths, 2; under five years, 1; typhoid fever 1. Huntingdon, Tenn., 1,200; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 700; no deaths. Jefferson, Tex., 3,251; death, 1. Kenosha, Wis., 5,500; deaths, 2; under 5 years, 1; scarlet fever 2. Louisiana, Mo., 5,200; death, 1. Madison, Ind., 9,009; deaths, 4; pneumonia 1, congestion of lungs 1. Marquette, Mich., 4,000; death, 1; consumption 1. Marshall, Tex., 5,449; no deaths. Meridian, Miss., 4,013; death, 1; consumption 1. Milledgeville, Ga., 3,000; deaths, 2; under 5 years, 1; puerperal 1. Mount Pleasant, Iowa, 4,500; deaths, 3. Muscatine, Iowa, 8,412; deaths, 2; consumption 1. Muskegon, Mich., 11,300; deaths, 3; under 5 years, 1; diphtheria 1, malarial fever 1, puerperal 1. Niles, Mich., 4,200; no deaths. Painesville, Ohio, 5,504; death, 1. Pearlington, Miss., 1,200; death, 1; diarrhœa 1. Phœnixville, Pa., 6,692; deaths, 6; under 5 years, 2; consumption 2. Pleasant Hill, Miss., 253; no deaths. Plymouth, Mich., 3,000; death, 1. Port Gibson, Miss., 1,200; death, 1; pneumonia 1. Port Royal, S. C., 750; death, 1; pneumonia 1. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 960; no deaths. Santa Cruz, Cal., 5,000; deaths, 2; consumption 1, typhoid fever 1. Springfield, Ohio, 21,000; deaths, 4; consumption 2. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 743; no deaths. Titusville, Pa., 9,000; deaths, 2; under 5 years, 1; consumption 1, whooping-cough 1. Tuscaloosa, Ala., 2,000; deaths, 5; under 5 years, 2. Watertown, Wis., 10,000; deaths, 3; under 5 years, 1; measles 1. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; death, 1; congestion of lungs 1. Youngstown, Ohio, 15,089; deaths, 4; under 5 years, 2; typhoid fever 1, pneumonia 1. Total population, 332,405; deaths under 5 years, 35; total number of deaths, 115; annual rate per 1,000, 18.0.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MARCH 5, 1881. [No. 36.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

QUARANTINE REPORTS.

NEW YORK CITY.—Dr. W. M. Smith, quarantine physician, sends the following report on small-pox, under date of January 24:

The following is a summary of cases of small-pox detected at this quarantine on vessels entering this port since the 1st of April last, with a brief statement of the disposition of the vessels.

Since the date mentioned small-pox has been found on fifteen vessels. Two deaths have been reported from this disease on vessels during their passage to this port, and 28 cases have been removed to the small-pox hospital at Blackwell's Island. They were taken from the following vessels:

April 2, ship *San Stephano*, from Antwerp, 1 death at sea, 3 cases on arrival. They were removed to hospital. The vessel was detained, and a fourth case developed the second day of detention. When with "all hands" satisfactory evidence of vaccination had been established, or the protective influence of previous vaccination shown by its failure, and the vessel had been thoroughly disinfected, the vessel was given pratique.

April 10, the schooner *C. B. Paine* entered port with 1 case of small-pox. The assurance that the case had been carefully quarantined on the vessel from the incipient stage was believed, and the vessel detained until all on board were vaccinated, and the vessel disinfected. A few hours sufficed for this purpose.

April 20, steamship *Zeeland*, 482 passengers, 79 crew; 2 cases on board, in the fourth day of eruption. Satisfactory evidence of isolation was given, and the vessel was allowed to proceed after vaccination of passengers and crew.

May 6, steamship *Hapsburg*, arrived from Bremen with 1,108 passengers, and reported 1 death at sea from small-pox. One case was detected in the first stage of the disease; assurances were given that the case buried at sea had been properly isolated from the beginning. The case on board, from the stage of its development, warranted the opinion that the infection had been received at the port of departure. The passengers and crew were vaccinated, the ship disinfected, and pratique was given the same day.

May 19, steamship *Gellert*, arrived from Hamburg with 1,012 steerage passengers. One case of small-pox was discovered in the steerage; this being in the initial stage of development, the usual precautions were adopted and the vessel allowed to proceed to her dock the same day.

May 22, steamship *Vaderland*, from Antwerp, with 142 steerage and 79 crew. One case of small-pox was detected which had not been isolated, owing to a mistake in the diagnosis by the ship's physician. The passengers and crew were vaccinated and detained under quarantine of observation until the results of vaccination were evident. All clothing was disinfected, the ship fumigated, and pratique given.

June 2, steamship *Herder*, arrived from Hamburg with 1,035 passengers and 110 crew, having 1 case of small-pox which had been isolated upon the first appearance of the disease. The ship was discharged without detention.

June 18, steamship *Main*, from Bremen, arrived with 726 passengers, having 1 case of small-pox. The ship was allowed to proceed after the usual course.

June 21, steamship *Arizona*, from Liverpool, arrived with 798 passengers, having 2 cases of small-pox.

July 13, steamship *Allemania*, from Hamburg, with 687 passengers, arrived having 2 cases. No detention was deemed necessary beyond the time required for vaccination and disinfection.

November 7, bark *Kings County* arrived from Antwerp. Her captain reported 1 death at sea, which, from his description, was considered sufficiently suspicious of small-pox to warrant her detention at quarantine. The third day of her detention two cases of the disease developed; and on the fourth, a third case. The vessel was disinfected and detained until the result of the vaccination of the crew was satisfactory, and was then allowed to proceed.

November 8, steamship *Castalia* arrived from Mediterranean ports, with 749 passengers. Two cases of small-pox were found at the 15th or 16th day of development. A temporary hospital had been provided on the forward deck for the purpose of isolating the cases. Assurances were reiterated that they had been properly quarantined. The free ingress and egress of the attendant from this temporary hospital warranted the gravest suspicion that proper isolation had not been secured. Subsequent developments would have justified the detention of the vessel and the subjection of the passengers to quarantine of observation. In the face of the protestation of medical and other officers of a vessel, that all proper and necessary measures have been adopted to prevent infection of passengers and crew, it is sometimes difficult, as in this instance, to determine the path of duty.

The opportunity for complaint by those whose interests are affected by the restrictions of quarantine is not likely to be unimportant, if, as in this case, they are supported by the officials whose duty it is, and who are presumed to have full knowledge of the circumstances.

Impressed with an earnest desire to relieve the burden which quarantine imposes, the passengers and crew of the *Castalia* were vaccinated, the vessel disinfected, and allowed to proceed without further detention.

The steamship *Italia* arrived at quarantine December 13, with 749 Italian passengers, who embarked at Naples the 16th of November, having touched at several other ports, but taking no passengers except at the first-named port. A girl of six years was received who had an eruption of a suspicious character. The officers of the *Italia* were disposed to reject this passenger, but other counsels prevailed and the case was permitted to mingle with the crowd in the steerage. On arrival at this port, the case referred to had entirely recovered, but the blue-stained cicatrices gave unmistakable evidence of a recent attack of small-pox.

Two other cases at about the tenth day of development were discovered—one a case of the severest type (*confluent*); the other more mild (*variola discreta*). Neither of them had been isolated or proper care taken to prevent contact with other passengers, except so far as the helplessness of the severest case compelled quiet and comparative seclusion in one of the steerage berths.

The less severe case was freely mingling with the steerage passengers, and was detected when passing the quarantine officer. There could be no reasonable doubt that more or less of the passengers had become infected by these exposures, and it would have been an act of reckless indifference to the public health to have allowed the passengers to go to the city until protected by satisfactory results of vaccination, or time had established evidence of escape from infection. On the 17th instant they were removed to Hoffman's Island for observation, and the day following the crew were again examined. Such as seemed to require it were revaccinated, the steamer cleaned up, disinfected with sulphurous acid gas, and discharged the fifth

day after arrival at quarantine. The passengers were detained until the result of the vaccination was satisfactory, or its failure believed to be the consequence of protection by previous vaccination. The examination on the fifth day showed that in 345 persons the vaccination gave evidence of satisfactory results; those in which it failed were revaccinated. On the ninth day the 404 that were revaccinated were again examined. Of this number 147 showed promising results from the second vaccination. In 207 of those in which both vaccinations had failed there were good cicatrices from previous vaccinations or small-pox, and these were taken as evidences of protection equally as satisfactory as those in which vaccination was successful.

Sixty persons, who gave no evidence of previous vaccination or the success of the vaccinations since their arrival, were vaccinated a third time, detained until the full period of fourteen days had elapsed since their arrival, and were then discharged.

The clothing of these passengers in every instance was changed before they were discharged, and, with their baggage, subjected for several hours to disinfection by sulphurous acid.

In several instances during the past season the neglect to provide early and proper isolation of cases of this disease has subjected vessels to detention.

It would be good economy for all steamship companies transporting passengers to employ experienced and vigilant medical officers. Upwards of three hundred and twenty thousand emigrants have entered this port since the first of January last. This great emigration has necessarily created much anxiety and required incessant vigilance on the part of the medical officers at quarantine, to prevent the introduction of this disease into the great cities that cluster around the port of New York, and into far interior communities.

The period of incubation in this disease is so much longer than the average passage of vessels from European ports to New York that infection received at the port of departure is liable not to develop until after passing quarantine, and perhaps penetrating hundreds of miles into the interior. Hence the utmost care and watchfulness is required by the health authorities along the great currents of immigration, and particularly at such distributing points as Buffalo, Chicago, and Saint Louis, to prevent the extension of the disease.

When cases of small-pox are found in the popular stage, or satisfactory evidence is given that they were properly isolated at and subsequent to that stage of development, neither ship nor passengers have been detained longer than was necessary to cleanse and disinfect the one and vaccinate the others. Vaccination of crew and passengers has been adopted in every instance: rather out of respect to the belief of some observers that the disease is communicable from the moment when the initiatory fever begins than from any proofs of this which have been afforded in the course of a pretty large experience.

Experience, however, conclusively proves that infection from small-pox may develop several days after the success of vaccination is apparent, and the two principles progress "hand in hand," each modifying the other perhaps, but productive in the case of small-pox of communicable infection.

The result of careful observation is that persons who have been exposed to the infective principle of small-pox should not be discharged from quarantine previous to the eighth or tenth day after successful vaccination.

NOTICE.—The attention of health officers and others who fill the weekly reports of mortality in cities of the United States, is especially invited to the change of form in the cards, and in the table compiled from them. In the column for the number of deaths, white and colored, those places only will hereafter be noted whose reports are definitely known to separate the diseases and the deaths of the two races, and which can furnish the respective populations. All populations not agreeing with those previously given have been changed in accordance with the figures furnished by the Census Bureau, and remain subject to correction from that office.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—The authorities of all cities supplied with the new form of postal card recently adopted by the National Board of Health are requested to return any remaining cards of the old form, and to fill up the new forms as completely as possible.

NOTICE.—The authorities of cities sending reports of mortality to the National Board of Health are respectfully requested to forward promptly the population as corrected by the Tenth Census. It is very desirable to have the white and colored populations given separately.

NOTICE.—The populations of cities of the United States adopted in the tables of the BULLETIN are those furnished by the city authorities to the National Board of Health. They differ in some cases from the figures given in mortuary reports.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING FEBRUARY 19, 1881.

Cities and States.	Total population, according to United States census of 1880.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Population, according to United States census of 1880.		Number of deaths.		Annual death-rate per 1,000.		Population under 5 years.		Number of deaths under 5 years.		Annual death-rate per 1,000.		Accidents.		Cerebro-spinal meningitis.		Consumption.

ABSTRACTS FROM CONSULAR REPORTS.

ALGIERS, AFRICA.—United States Commercial Agent Alex. Jourdan reports 182 deaths for three weeks ending January 30, in a population of 68,055; annual death-rate 46.5 per 1,000. From typhoid fever, 9 deaths are reported, but no epidemic disease prevails. Mean temperature 64°.

BORDEAUX, FRANCE.—For the month of December, United States Consul B. Gerrish reports 14 deaths from small-pox, 8 from typhoid fever, and 22 from other contagious diseases. Total deaths, 471; population, 215,140; annual death-rate 25.8 per 1,000. Of the decedents, 59 were under one year and 95 over 70 years of age. Consumption caused 66 deaths and other lung diseases 67.

GHENT, BELGIUM.—United States Consul A. Lefebvre sends a report for the year 1880, giving a total of 3,848 deaths and 165 stillbirths. There were 1,056 marriages and 4,438 births, of which 574 were illegitimate.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett reports, under date of February 5, that several cases said to be yellow fever had occurred on board of two French vessels in the port of Pointe à Pitre. He found on inquiry at the marine hospital that some mild cases had been under treatment there as yellow fever, but there was no apprehension that it would spread. No sickness among American vessels, and the town being free from contagious diseases, clean bills of health were still issued.

MADEIRA.—United States Consul Thomas B. Reid, under date of February 1, states that no reliable statistics can obtained from the authorities of Funchal, but that Dr. Goldschmidt, a German physician, will furnish a report of deaths on the island for the year 1880.

MARACAIBO, VENEZUELA.—United States Consul E. H. Plumacher, in his report for the month of January, states that no reliable information can be obtained as to mortality or disease. The city has a population of about 10,000, and is not in good sanitary condition, as no artificial provision whatever is made for drainage.

PALMA, CANARY ISLANDS.—United States Consul W. F. Lavers sends reports for two months. In November there were 12 deaths, giving an annual rate of 23.7; in December, 14 deaths; annual rate, 27.7 per 1,000. The causes of death are not stated. Sanitary condition good.

SANDWICH ISLANDS.—Under date of February 10, United States Consul F. P. Hastings reports that small-pox has recently appeared at Honolulu, and up to that date 40 cases had been reported. Quarantine measures had been enforced to prevent the disease from spreading to other islands. The contagion is supposed to have been introduced by emigrants from Canton, China.

The consul also forwards the report of Dr. Charles Neilson, who has succeeded Dr. Emerson as superintendent of the leper settlement on the island of Molokai. At the close of the year 1880 there were 609 persons in the settlement, and 161 had died during the year. Nine children were born of leprous parents, and 6 deaths occurred under one year of age. Dr. Neilson observes that efforts to improve the hygienic condition of the lepers meet with no aid from them, a marked feature of the disease being a condition of apathy and despondency. The government has made liberal provision for the afflicted, in providing good shelter and an ample supply of wholesome food. Among the remedies in use, an oleo-resinous substance, known in commerce as gurgun oil, is considered the most valuable, especially when combined with lime-water. The treatment is, however, empirical, and is addressed rather to special symptoms than to cure of the disease. Leprosy is regarded as undoubtedly contagious.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING FEBRUARY 19, 1881—Continued.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic or contagious diseases up to January 17.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—During the week ending February 18 there was but 1 death from yellow fever; from small pox 22 deaths were reported.

MINSTER, OHIO.—Dr. E. F. Wells reports, under date of February 25, that erysipelas and puerperal fever have prevailed for some time, and many cases of true croup have occurred, but none proved fatal. Most chronic diseases have been aggravated by the unusual cold of the past two months.

NASHVILLE, TENN.—Under date of February 20, Dr. W. M. Clark, secretary of the State board of health, forwards a copy of a resolution adopted by the board, urging the necessity of vaccination and revaccination in all parts of the United States.

The following reports for the week ending February 19, 1881, are from places which do not require burial permits:

Alexandria, Va., 13,000; deaths, 6; under 5 years, 3; accident 1; consumption 1, croup 1, bronchitis 1, old age 1. Allegheny, Pa., 78,000; deaths, 36; under 5 years, 16; accident 1, consumption 3, diphtheria 2, scarlet fever 3, pneumonia 6, bronchitis 1, suicide 1. Bath, Me., 8,000; deaths, 2; consumption 1, pneumonia 1. Belfast, Me., 5,308; deaths, 2; erysipelas 1, old age, 1. Brattleborough, Vt., 6,000; no deaths. Calais, Me., 6,162; deaths, 4; under 5 years, 1; consumption 2, accident 1. Carrollton, Miss., 600; no deaths. Chico, Cal., 3,700; no deaths. Chillicothe, Ohio, 11,000; deaths, 9; under 5 years, 5; diphtheria 1, scarlet fever 1, pneumonia 1, puerperal 1. Columbus, Ga., 10,000; deaths, 2; under 5 years, 1; pneumonia 1. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 855; no deaths. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Gunn City, Mo., 125; no deaths. Helena, Mont., 3,630; deaths, 3; under 5 years, 1; congestion of lungs 1, measles 1. Hernando, Miss., 1,000; no deaths. Huntingdon, Pa., 4,500; typhoid fever, 1. Huntingdon, Tenn., 1,200; old age 1. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; consumption 1. La Salle, Ill., 8,885; deaths, 3; under five years, 1; accident 1, consumption 1, diphtheria, 1. Louisiana, Mo., 5,000; deaths, 2; pneumonia 1. Madison, Ind., 9,000; no deaths. Marquette, Mich., 4,000; accident 1. Martinsburg, W. Va., 6,384; 1 death, under 5 years. Massillon, Ohio, 6,876; no deaths. Meridian, Miss., 4,013; deaths, 2. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; 1 death, under 5 years. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; puerperal 1. Muskegon, Mich., 11,300; deaths, 3; consumption 1, malarial fever 1, puerperal 1. Niles, Mich., 4,200; bronchitis 1. Okolona, Miss., 2,000; no deaths. Painesville, Ohio, 5,500; deaths, 3; accident 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 243; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, Cal., 5,000; deaths, 2; consumption 1. Senatobia, Miss., 1,000; deaths, 3; pneumonia 2, puerperal 1. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,000; no deaths. Tuscaloosa, Ala., 2,000; no deaths. Winchester, Va., 5,000; deaths, 4; under 5 years, 1; consumption 1, bronchitis 1. Winona, Minn., 10,000; typhoid fever 1, under 5 years. Youngstown, Ohio, 15,090; bronchitis 2. Total population, 290,857; deaths under 5 years, 32; total number of deaths, 97; annual rate per 1,000, 17.1.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MARCH 12, 1881. [No. 37.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

CHICAGO, ILL.—Dr. H. A. Johnson, member of the National Board of Health, under date of March 8, forwards the following report by a physician who has studied the subject of the epidemic of *winter cholera* which has prevailed in several western cities:

The epidemic of so-called winter cholera the present winter in Chicago is noteworthy as decidedly modifying the usual health condition of the city, and, also, for its own peculiarities. From all that can be learned from conversation with physicians it appears that it became suddenly prevalent about the holidays, though there are records of a rather unusual amount of diarrhœal trouble earlier in December. One of our leading druggists reports a notable increase in the number of prescriptions for diarrhœa and cholera mixtures early in December, but the marked increase occurred about the close of the month. At this time, and especially after a sudden cold spell that occurred then, the fact was so notable that it came to the ears of a reporter for the daily press and was duly inserted as an item of city news. From that time to the present the epidemic has continued with more or less violence, but now seems to be somewhat abating. It is not possible to even approximately estimate the degree of its prevalence with any certainty. The disorder has made no marked figure in the mortality reports, and there are no returns of non-fatal diseases. Judging from the number of cases mentioned to me by physicians as having come under their own observation and treatment, and allowing for the whole number in the city, as well as the very large probable number of cases where no physician was consulted, I should say that at least fifteen or twenty thousand cases have occurred; and perhaps thirty or forty thousand, of all degrees of mildness or severity, would be more nearly correct. In one of the principal suburbs, where it was easier to make an estimate, and where it was, to all appearances, much less prevalent than in the city, nearly two per cent. of the population were more or less affected. Here, too, according to the experience of some physicians, a majority of the cases were adult males, whose business carried them to the city every day.

The form of the disease varied in different cases. In many there was only a simple diarrhœa, much like that of the summer, and this was generally readily checked by medicines, or ceased of itself. Others suffered from a severer and more persistent diarrhœa, more or less frequent watery discharges from the bowels, causing, when frequent, great exhaustion, and even producing collapse if not attended to. It was very liable to recur after having been checked, and in a few cases, at least, appeared, when untreated, to be remittent, appearing a day or two and then ceasing for a similar period, and so on, but not with perfect regularity. Pain was often present, but not invariably; not, as a rule, much fever, except in children.

In still another class of cases, and these were quite numerous, there was with the diarrhœa more or less marked gastric disturbance, in some instances very severe, with excessive thirst and dryness of the mouth, great pain in the upper abdominal region, and often nearly all the symptoms of acute gastro-enteritis. These latter were observed accompanied with obstinate constipation in a few cases, which nevertheless appeared to come otherwise under the general class described.

The following memoranda of the symptoms are furnished by Prof. J. A. C. Hollister of the Chicago Medical College, who treated personally over one hundred cases in his private practice.

"The two features that have attracted attention in this affection are the severity of the vomiting and the copious discharges from the bowels.

"The matters rejected from the stomach have usually given slight acid reaction, at the first consisting mainly of aliment and drinks, readily rejected, and then mucous secretion from the stomach sometimes tinged with bile, sometimes not. The alvine evacuations have been markedly of a serous character; a fact specially noted. In some cases the typical appearance of bilious diarrhœa, giving the stool a bright yellow color, in others an absence of bile. The discharges varying from a bright creamy color to those charactistic of cholera, only that in them I have not noticed coagulated albumen.

"The urine is usually rather scanty and high colored until the diarrhœa is controlled.

"The nervous system, aside from the sense of prostration, does not seem to manifest disturbance.

"The mucous secretion is partially arrested in the respiratory passages, and especially in the mouth and fauces.

"The capillary circulation of the skin varies, but there is no uniform marked disturbance of the circulation.

"The subjective symptoms are, in the order of their severity—

"1. Inordinate thirst, with dryness of tongue and fauces.

"2. More or less frequently recurring nausea, with vomiting.

"3. Tenderness over umbilical region covering region of small intestines.

"4. Quite frequently a sense of fullness and pain in the region of the liver, with sometimes excessive secretion, and at others seeming congestion, with arrest of biliary secretion.

"5. Fugitive pains in various parts of the body."

In the practice of some physicians the choleraic discharges were not observed, all the stools being characterized simply by the absence of bile. The implication of the liver function was a very common feature, and jaundice was produced in some of the severer cases.

The onset of the disease was usually sudden; patients in some extreme cases on rising in the morning felt only a slight dryness in the mouth, but found themselves unable to keep even a drink of water on the stomach. Generally, however, the onset, though sudden, was not so abrupt as this.

The duration of the disease was very variable—many even of the severer cases recovered within a few days, sometimes within a few hours under prompt treatment; others have lasted many weeks.

As after-effects, there have been observed, besides the jaundice already mentioned, subacute enteritis, dysentery, and ulceration of the rectum. In most cases a tendency to relapse was observed, and changes of weather were very influential in bringing this about, as well as influencing the course of the disease during its existence. Imprudence and exposure generally were thought to produce it or to aggravate it.

During the earlier weeks of the epidemic the disease appeared to be mostly confined to adults, but later children were also attacked to some extent, the trouble in them often taking the form of cholera infantum. Although it was said in the beginning that the epidemic made no marked figure in the mortality reports, corresponding with its prevalence, yet there have been one or two deaths reported from it, and it has been mentioned in connection with other diseases in a

number of death certificates. The number of deaths reported from cholera infantum has also been larger than usual at this season during the last few weeks. There is no doubt but that it has had its effect in increasing the mortality, though not very much can be attributed to it alone.

The nature and cause of the disease are not very manifest, according to observations in Chicago. Some physicians in large practice have had no cases except adults, and the majority males; others have found no reason to think that either age, sex, or occupation is a factor in its production. Previous conditions of health or debility also appear to make no figure in its causation; the majority of the patients were, it is probable, in a fair or robust health when attacked.

Popular opinion was at first inclined to attribute it to the excessive cold of the winter, and many physicians were inclined to share the opinion. Bad sewerage and ventilation could not be generally credited with its production, as it occurred equally where nothing was wrong in these respects. It is probable, however, that it was aggravated in some instances by bad sanitary conditions. The fact that the disorder occurred simultaneously in many widely-separated localities over the country is against the idea of any local conditions producing it—such as the drinking-water, which was constantly and carefully watched by Dr. DeWolf and the health officers without finding any marked impurity, notwithstanding the fact that the Fullerton avenue conduit was discharging from the North branch into the lake all winter. A number of physicians of extensive observation strongly suspected a malarial element in the disorder. In this connection I may state that a well-known physician from the interior of the State, Dr. Howard, of Champaign, has said that in his town he had seen a large number of cases of severe bowel complaint this winter in children, and very few in adults. In all, or nearly all, cases he found that the sufferers had been eating snow, and that the disease was apparently directly traceable to that. He also favored the idea of its malarial character, at least in part. The facts known are very suggestive, but it will require a much more extensive inquiry at a later period to justify any positive deductions.

The treatment of the disorder, as might be expected, is extremely various, but pretty uniformly successful. The only general practices, and these were not universal, were the employment of the mineral rather than the vegetable astringents, the use of opium in some form, and of bismuth. Most practitioners, it is probable, used mercury also in the commencement of the treatment of a case, on the theory that it would act on the disordered hepatic functions; some confined the medication almost entirely to the bismuth and pepsin, with careful dietary, and nearly all attached much importance to this last measure in the treatment of this disorder. Many used quinine in pretty fair doses, and some considered that its use was the best prophylactic against a relapse. In the beginning of the epidemic, cholera mixtures, such as Hamlin's, were much used, but later other measures were more in favor. The success in a greater or less degree of nearly all methods of treatment, directed on general principles to the condition, indicates the comparative manageableness of the disorder. Warm weather it is said was accompanied usually with an abatement of the disease, and it has apparently much decreased, at least in adults, since the middle of February. If we are not to attribute it to the extraordinary cold weather of the past winter, perhaps we may credit its docility to treatment to the same antiseptic condition.

As the epidemic is not entirely over it is too early to draw conclusions or to sum up observations that are yet of necessity incomplete. The above notes are offered simply as a sort of preliminary report, to be followed, it is to be hoped, at some future time by the results of a more complete investigation.

EVANSVILLE, IND.—Dr. J. W. Compton, under date of March 8, reports that cerebro-spinal meningitis is almost epidemic, and the cases are of the gravest type, having been generally fatal in from three to six days. An inclosed report of mortality in Evansville for the year 1880, gives the following among the principal causes of death: Diarrhœal diseases, 71; consumption, 102; other lung diseases, 71; measles, 27; scarlet fever, 37; typhoid fever, 55; diphtheria, 15; whooping cough, 5; accidents and injuries, 15. Total deaths, 632; excluding still and premature births, annual death-rate 21.5 per 1,000.

FAIRFAX C. H., VA.—Under date of March 8, Dr. R. W. Dorsey sends the following report of Fairfax County:

Since the subsidence of the malarial fevers that prevailed so generally in this section during the past summer and autumn, there has been very little sickness, except such as was caused by the intense cold of the past winter.

From diseases arising from this cause there has been a considerable fatality, particularly among the aged. During the last two months measles have been epidemic in the county, and there are still many cases. I have heard of no fatal cases so far.

One case of small pox was reported some three weeks since, but upon proper inquiry it was decided to be erroneous. I have lately seen three cases of fever in a family near by, which in some particulars, strongly resembled typhus. The house occupied by this family is in a most unsanitary condition; the well from which their drinking water is obtained is also very foul, and there is good reason to believe that the water of the same is polluted by decomposing vegetable and animal matters.

The occurrence of a somewhat similar case of fever in a family adjoining the one alluded to, who use drinking water obtained from the same source, would suggest that possibly these cases originated from the same cause.

In accordance with the published request of the National Board of Health, these facts will be reported for the consideration of the proper analysts.

This is only one case of many that could be cited of the unsanitary state of premises in the rural districts, and points suggestively to the need of sanitary legislation for the benefit of every home in the land.

It is to be regretted that, beyond the localities protected by local sanitary laws, so few even of the medical profession are interested in public sanitation, and while this is the case, and while scarcely any of the masses of the people manifest an interest in the same, it can easily be seen that the nearest way to an improvement is by instituting a system of sanitary education, and the enactment and strict enforcement of special laws directed to this most important subject.

HAVANA, CUBA.—During the week ending February 25, 2 deaths from yellow fever and 16 from small-pox are reported. One of the deaths from yellow fever was in a military hospital, the other in the city.

NASHVILLE, TENN.—Dr. W. M. Clark, secretary of the State board of health, forwards the reports for forty-three places, as collected by the board. The remarks indicate an extensive prevalence of zymotic diseases during the month, but no high rate of mortality from any of them. Of 363 deaths reported, 98, or 27 per cent., were under 5 years of age, being a smaller proportion than the usual ratio for the whole country, which is about 35 per cent. Consumption has been prominent among the causes of death, and the increased mortality from this and other pulmonary diseases is ascribed to the inclement weather. The omission of estimates of population prevents any comparison of death-rates for the localities reporting.

SAINT ALBANS, VT.—March 9.—Dr. A. A. Hall reports no deaths during the week ending March 5. The village has about 6,000, and the whole town about 7,195 inhabitants.

WHEELING, W. VA.—Under date of March 9, Dr. T. O. Edwards states that the bill to establish a State board of health for West Virginia was passed March 8. Weekly reports will be sent from Wheeling.

WILMINGTON, N. C.—Under date of March 8, Dr. T. F. Wood reports a case of small-pox and 1 of varioloid as brought in on the vessel *Katie Collins*. The patients were transferred to the hospital for such diseases four miles from Wilmington.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

MEAN DEATH-RATE PER ANNUM FOR EACH MONTH OF THE YEAR 1880, FOR NINE PRINCIPAL CAUSES OF DEATH.

(Based on a mean population of 8,100,000, sending regular weekly reports of mortality.)

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—United States Consul B. Gerrish reports for the month of January, 12 deaths from small-pox, 17 from typhoid fever, and 29 from other contagious diseases. Consumption caused 88 deaths, other lung diseases 63, and brain diseases 51. The total mortality was 544; population, 215,140; annual death-rate 29.7 per 1,000.

CEYLON.—United States Consul W. Morey, inclosing a series of meteorological observations for 1880, observes that his district has remained free from epidemic or contagious diseases during the year.

GHENT, BELGIUM.—United States Consul A. Lefebvre reports for the month of January, 3 deaths from typhoid fever, 7 from scarlet fever, and 1 from diphtheria. Consumption caused 49 deaths, bronchitis and pneumonia 65, and diarrhœal diseases 32. Total mortality, 305; population, 130,670; annual death-rate, 27.5 per 1,000.

GIBRALTAR, SPAIN.—United States Consul H. J. Sprague sends a report for the year 1880, showing a total of 382 deaths in a population of 18,000; annual death-rate, 21.2 per 1,000. No deaths from exanthemata appear on the list. Of 23 cases reported as small-pox, at least 20 proved to be varioloid. Of 22 cases of enteric and other fevers, 9 were from the vessels arriving in port. The deaths from lung diseases were only 77, against 127 for 1879, and the general health of the civil population has been remarkably good during the year.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett, under date of February 12, reports that yellow fever has increased in the port of Pointe à Pitre. Four French vessels have most of their crews in hospital, and the disease has appeared on three other vessels. About 30 cases were supposed to exist in the hospital and shipping. The troops have all been removed to the mountains. The last clean bills of health were issued to schooner *Timothy Field*, for Key West, February 7, and brig *Favorite*, for New York, February 8. The consul remarks that these bills would not have been given had he been fully informed as to the extent of the fever at that time. An appropriation has been made for improvement of the sanitary condition of the city.

GUAYMAS, MEXICO.—United States Consul A. Willard forwards the official report of mortality for January, showing a total of 11 deaths, of which 4 were under 5 years of age. Eight deaths are ascribed to "fever," presumed to be malarial. The general sanitary condition is good, the annual death-rate being 24 per 1,000, and no epidemic prevailing.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton, under date of February 19, reports 10 deaths from small-pox during the preceding week. He also incloses a printed copy of resolutions adopted by the leading physicians of Brownsville, Tex., having in view the suppression and prevention of small-pox. The first resolution provides for compulsory vaccination and house-to-house medical inspection. It is noted that one of the Spanish (or Mexican) physicians signs the paper with a record of dissent from the first resolution.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer reports for the month of November, 3 deaths from cholera, 6 from typhoid fever, and 14 from other contagious diseases. Total mortality, 445; population, 265,000 (including suburbs); annual death-rate, 20.0 per 1,000.

ST. THOMAS, WEST INDIES.—United States Consul Victor Thompson desires a correction of the word *epidemic*, as applied to yellow fever in St. Thomas, reported in No. 28 of the BULLETIN. The disease was described as prevailing at the time and as *endemic*, but not considered *epidemic*.

SYDNEY, AUSTRALIA.—The report of the registrar-general being based upon the population of 1871, can not give any accurate estimate of relative mortality for the current year. During the month of November, 1880, the births were 329 and the deaths 300 in the city. Zymotic diseases furnished 28 per cent. of the deaths, measles and diarrhœa being the most fatal. Including the suburbs, 727 births, and 574 deaths are reported, the proportion under 5 years being 64 per cent. of all deaths in the city, and 67.5 per cent. for the suburbs and city together.

HAVANA, CUBA.—During the month of February there were 5 deaths from yellow fever and 89 from small-pox. For the week ending March 4, no deaths from yellow fever are reported, but 31 occurred from small-pox. The American bark *Esther* had 2 cases of small-pox among her crew. Both were sent to the hospital, where 1 died. The rest of the crew were vaccinated and the vessel disinfected.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING FEBRUARY 26, 1881—Continued.

CORRECTION.

The report of total deaths in the District of Columbia, in the table of mortality for the year 1880, No. 34 of the BULLETIN, should be 4,122 for the 52 weeks ending January 1, 1881. The corresponding annual death-rate, for a population of 180,000, would be 22.9 per 1,000.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MARCH 19, 1881. [No. 38.

MONTHLY REVIEW FOR FEBRUARY, 1881.

The increase of population represented during the four weeks ending February 26 has been chiefly in the Northeast section, and the mean for this month is 8,080,122, being an addition of 524,832 to that of January. A rise of only 1 per cent. is observed in the general death-rate, but that of children under 5 years has increased from 7.62 to 8.40, or 9 per cent. since January. It is seen that at least one-half of the principal diseases show no appreciable change in their death-rates, as compared with those of last month, excepting the spread of small-pox, which is still too imperfectly reported to give any value to anestimate of its relation to other diseases on the list of mortality.

Causes of death.—The two principal diseases have nearly balanced each other in their oscillation this month, consumption having fallen 2 per cent., while acute lung diseases have risen 3 per cent. The most marked changes are observed in diphtheria and croup, which have decreased respectively 18 and 17 per cent. The other zymotic diseases which show increased mortality are whooping-cough, which has risen 17 per cent., and malarial fevers, which are 15 per cent higher than last month. Neither of these, however, give a death-rate above 0.23 per 1,000. The remaining diseases of this class, while showing slight changes in different sections, have preserved their general rate of mortality unaltered since January. Small-pox continues to attract attention by its rapid spread over the country, the Southeast section, excepting Texas, being alone exempt at present. The quarantine physician of New York has pointed out the danger arising from the fact that the transit to this country from Europe now occupies a shorter time than the period of incubation of the disease, and shows the importance of detaining emigrants a sufficient time under observation. In the absence of such precaution, small-pox is liable to appear in persons after landing in apparent health, and to be disseminated along the great routes leading from the Atlantic ports to the West. The danger constantly menacing this country with infection from Canada and from Mexico has been frequently mentioned.

Distribution of diseases.—The Northeast section shows the same average mortality as in January, which is to be expected, as this section represents over 60 per cent. of the population included in the weekly reports, and therefore indicates most nearly the average death-rate of the country. The rate for February in this section is 24.34 per 1,000, being intermediate between the other two.

In the Southeast section the highest rate of mortality is observed, a general increase in the death-rates of the zymotic diseases having occurred. Whooping-cough, especially, has more than doubled its rate, though still giving but 0.21 deaths per 1,000. Measles have increased 62 per cent., and scarlet fever and enteric fever 25 per cent., with malarial fevers 20 per cent. higher than last month. These diseases have raised the general mortality for this section to 26.24 per 1,000; the pulmonary diseases show but little change.

In the Northwest, consumption has declined only 3 per cent., but lung diseases have fallen from 3.78 to 3.08, or nearly 20 per cent. Diarrhœal diseases and whooping-cough show a slight increase, but a reduction of the mortality from other zymotics has lowered the death-rate from 21.75 to 20.42 per 1,000. The prevalence of diarrhœal diseases in this section during the winter has attracted attention, though the mortality from them was only 0.32 in January, and 0.35 for this month. In Illinois and other Northwestern States, the epidemic of such diseases has received the name of "winter cholera," and since December it has affected a large proportion of the population, though with few deaths resulting.

The distribution of the deaths reported from small-pox in February shows how widely the disease is spread, though the mortality given in the reports must be only a small part of that actually occurring. Fourteen cities have reported deaths during the month, as follows: New Britain, Conn., 1; New York City, 22; Brooklyn, 4; Hudson County, N. J., 6; Newark, N. J., 1; Camden, N. J., 1; Orange, N. J., 2; Philadelphia, 203; Pittsburgh, Pa., 6; Wilmington, Del., 1; Brownsville, Texas, 21; Chicago, 32; Davenport, Iowa, 1; San Francisco, 1. Total, 308, against 262 for January.

SANITARY LEGISLATION IN WEST VIRGINIA.

The following bill has been passed by the Legislature of West Virginia for establishing a State board of health, and regulating the practice of medicine and surgery:

Be it enacted by the Legislature of West Virginia:

SECTION 1. The governor shall appoint two physicians from each congressional district, who shall be graduates of respectable medical colleges, and of not less than twelve years' continuous practice in their profession, and have distinguished themselves by devotion to the study of medicine and the allied sciences, who shall constitute the State board of health.

The terms of office of the persons so appointed shall be so arranged that the terms of two of them shall expire at the end of every second year. Vacancies in the board shall be filled by reappointment or otherwise by the same appointing power.

SEC. 2. The board so appointed shall take the oath of office prescribed by the constitution for other State officers, and receive from the secretary of state certificates of their appointment.

SEC. 3. The board shall meet within twenty days after receiving notice of their appointment, at such time and place as the first-named member of the board shall designate; and shall organize by the election of a president and secretary from their own number, who shall occupy such positions until their successors are elected; and they may adopt all necessary rules and regulations for the dispatch of business. The board shall also provide for itself a suitable seal. A majority of the board shall constitute a quorum; and they are authorized to send either the secretary or president, or a special committee of the board, to consult and co-operate with the National Board of Health, or other sanitary organizations, whenever they may deem it necessary for the public good.

SEC. 4. The secretary shall be the executive officer of the board, shall superintend and perform the work prescribed in this act, and perform such other duties as the board shall direct; shall respond to all communications of the local boards of health, hereinafter provided for, and give such advice as may be deemed necessary; and in case of the prevalence of endemics, epidemics, infections and contagious diseases, or other unusual sickness, he shall, on the request of the local boards of health, visit the locality and adopt such regulations for its suppression as may seem best. He shall annually report to the governor, on or before the first day of January, the investigations, discoveries, and recommendations of the board, which shall be printed and distributed as soon as practicable thereafter, in the same manner as other public documents of the State.

SEC. 5. The board shall take cognizance of the interests of the life and health of the inhabitants of the State, and shall make, or cause to be made, sanitary investigations and inquiries respecting the causes of diseases, especially of endemics, epidemics, and the means of prevention, the sources of mortality, and the effects of localities, employments, habits, and circumstances of life on the public health. They shall also investigate the causes of diseases occurring among the stock or domestic animals in the State, the methods of remedying the same, and shall gather information in respect to these matters and kindred subjects for diffusion among the people. They shall also advise with regard to the location, drainage, water supply, heating and ventilation of public buildings, school-houses, the ventilation of coal mines, and the drainage and sewerage of towns and cities.

When they may believe there is a probability that any infectious or contagious disease will invade this State from any other State, it shall be their duty to take such action and adopt and enforce such rules as they may, in the exercise of their discretion, deem efficient in preventing the introduction and spread of such disease or diseases. The better to accomplish such objects, the board are empowered and directed to establish, and strictly maintain, quarantine at such places as they may deem proper, and may adopt rules and regulations to obstruct and prevent the introduction or spread of infectious or contagious diseases to or within the State. They may enforce inspections of persons and articles of baggage, or other goods of whatsoever character, as well as the purification of the same; and companies or individuals operating or controlling railroads, steamboats, coaches, public conveyances, and steamers plying the Ohio River or its tributaries in this State, shall obey the rules and regulations when made and published by the State board of health, and any owner or owners, person or persons, having charge of any railway train, passenger coach, steamboat, or public or private conveyance, who shall refuse to obey such rules and regulations when made and published, shall be held to have committed a misdemeanor, and for each offense shall be punished by a fine of not less than fifty dollars nor more than five hundred dollars, to be confined in the county jail not less than fifteen days nor more than two months, or be either so fined or imprisoned, or both, in the discretion of the jury trying the case, to be recovered in any court of competent criminal or penal jurisdiction.

SEC. 6. It shall be the duty of the State board of health, with the consent of the county court, to appoint three intelligent and discreet persons, one of whom, at least, shall be a legally qualified practicing physician, citizens residing in each county of this State, who shall constitute a *local board of health* for the respective counties in which they reside, and such persons, as members of the local board, shall hold their office for the term of two years from the date of their appointment; and such local boards are empowered, and it shall be their duty, to inaugurate and execute and require the heads of families to execute such sanitary regulations as the local board may consider necessary to prevent the outbreak and spread of cholera, small-pox, scarlet fever, diphtheria, and other endemic, infectious, and contagious diseases, and they are empowered to go upon and inspect any premises which they may believe are in an unclean or infectious condition, and the said local board are authorized to enforce the rules and regulations of the State board of health. And it shall be the duty of physicians practicing in any county in which a local board is organized to report promptly all or any of the above-named character of disease under their special treatment to such local board, and such local board shall make report of the same to the State board of health at least once in every three months—first, of the character of the infectious, contagious, endemic or epidemic disease prevailing in their county; second, the number of persons reported as infected with such disease; third, the action taken by such local board to arrest the progress of such prevalent disease, and the visible effects of such action.

The provisions for local boards of health shall not apply to cities and towns having boards of health, but where such local boards of health are already established in cities and towns they shall be auxiliary to and act in harmony with the State board of health.

SEC. 7. In the counties bordering on the Ohio River and its tributaries, and on the State line separating West Virginia from the State of Kentucky, the local boards of health are empowered to declare quarantine in said county or counties, or in any particular place or places therein, against the introduction of any contagious or infectious disease prevailing in any other State or county: *Provided*, That as soon as such quarantine is established the local board declaring the same through its presiding or chief officer shall, in writing, notify the district members of the State board of health of such quarantine and the extent thereof, and thereupon the State board of health, in the exercise of its supervising power over local boards, shall, as early as practicable, ascertain the necessity of such quarantine, and shall either approve of and enforce the said quarantine or declare the same raised.

SEC. 8. The State board of health and its agents, employés, or the local boards of health, acting under the direction and regulations of the State board, when they have reasonable grounds to believe that any packet or other steamboat, barge, or other water craft navigating the Ohio River or its tributaries, is infected with any infectious or contagious disease, are empowered to prevent the landing of such craft at any point on the West Virginia shore, or elsewhere within the State, and they are also empowered, when they have reasonable grounds to believe that any such railway train, coach, or other vehicle contains persons, or goods of whatsoever character, infected with contagious matter, to detain at any station or point on such railway or road such train, coach, or vehicle for a time sufficient to disinfect and purify the same: *Provided*, Quarantine has been established at such station or place by action of such boards; and any railway conductor, or person in charge of the same, who shall willfully avoid or prevent the inspection, disinfection, and purification of the conveyances above named in his control, shall be guilty of a misdemeanor and liable to the penalty hereinbefore mentioned, to be recovered in the circuit court of any county where the offense has been committed.

SEC. 9. Any person practicing medicine in any of its departments shall possess the qualifications required by this act, viz: If a graduate in medicine, he shall present a diploma to those members of the State board of health appointed for his Congressional district for verification as to its genuineness. If the diploma is found to be genuine and issued by a reputable medical college, and recognized as such an institution, and if the person named therein be the person claiming and presenting the same, the said two members of the State board of health shall issue a certificate to that effect; and such diploma and certificate shall be conclusive as to the right of the lawful holders of the same to practice medicine in the State of West Virginia. If not a graduate of such medical college, as above designated, every person practicing medicine in this State shall present himself before the said two members of the State board of health in his Congressional district, together with the presiding medical officer of the local board of health of the county in which the respective district members of the State board may hold their examinations, as the board shall require; and if the examination be satisfactory they shall issue a certificate in accordance with the facts, and the lawful holder of such certificate shall be entitled to all the rights and privileges herein mentioned, except that physicians who have been engaged in the continuous practice of medicine in this State for more than ten years at the date of the passage of this act shall, in lieu of a diploma or examination by the members of the State board of health, present to the said board an affidavit as to the number of years they have been engaged in the practice of medicine, and the said board shall issue its certificate to such physicians without requiring an examination.

The members of the State board of health in each Congressional district shall give not less than twenty (20) days' public notice of the time and place of their meetings, in order to accommodate applicants for certificates.

SEC. 10. Every person holding a certificate from the State board of health shall have it recorded in a book kept for that purpose by the secretary of the State board of health, and the record of the same shall be indorsed upon said certificate with the seal of the State board of health, and signed by the president and secretary of the same.

SEC. 11. Each candidate on presenting himself for examination shall be possessed of a good moral character, temperate habits, and shall pay a fee of ten dollars, which shall be returned to him if a certificate be refused. In case an applicant for a certificate fail to pass a satisfactory examination, he may within nine (9) months thereafter appear again before the board in his Congressional district for a second examination; and if he then fail to pass a satisfactory examination, he may appeal from the decision of the board in his Congressional district to the State board, which, at its next meeting, shall examine such applicant, and if the examination prove satisfactory the State board shall grant him a certificate upon the payment of fifteen (15) dollars; but if the State board refuse such applicant a certificate, the examination shall be final: *Provided*, That if any person shall fail to pass a satisfactory examination before the board in his Congressional district within four (4) months after this act takes effect, he may appeal at once before the State board, which board, within thirty (30) days after such appeal is made, shall examine the applicant, and should the examination prove satisfactory, the said board shall grant such applicant a certificate upon tha payment of fifteen (15) dollars; but such examination, if the applicant be refused a certificate, shall be final.

SEC. 12. Examination may be, in whole or in part, in writing, and shall be of an elementary and practical character, and shall embrace the general subjects of anatomy, physiology, chemistry, materia medica, pathology, pathological anatomy, surgery, and obstetrics, but sufficiently strict to test the qualifications of the candidate as a practitioner of medicine, surgery, and obstetrics. The provisions of this act shall not apply to females practicing midwifery.

SEC. 13. Any person shall be regarded as practicing medicine, within the meaning of this act, who shall profess publicly to be a physician, and to prescribe for the sick, or who shall append to his name the letters "M. D." This act shall also apply to apothecaries and pharmacists who prescribe for the sick. This act shall not apply to commissioned officers of the United States Army and Navy and Marine Hospital Service.

SEC. 14. Any itinerant physician who shall practice or offer to practice medicine within this State, or who shall by writing or printing, or any other method, publicly profess to cure or treat diseases, injuries, or deformities, shall pay to the State treasurer a special tax of fifty ($50) dollars for each and every month and fraction thereof he shall so practice.

SEC. 15. Any person practicing medicine, surgery, or obstetrics in this State without complying with provisions of this act, shall be punished by a fine of not less than fifty dollars nor more than five hundred dollars, or by imprisonment in the county jail for a period of not less than thirty days nor more than one year, or by both such fine and imprisonment for each and every offense; and any person filing or attempting to file as his own the diploma or certificate of another, or a forged affidavit of identification, shall be guilty of a felony, and upon conviction shall be subject to such fine and imprisonment as are made and provided by the statutes of this State for the crime of forgery.

SEC. 16. The secretary of the State board of health shall receive a salary which shall be fixed by the board; he shall also receive his traveling and other necessary expenses incurred in the performance of his official duties. The other members of the board shall receive no compensation other than traveling and other necessary expenses while employed on business of the board. The president and secretary of the board shall certify all bills ordered to be paid by the board. Such bills shall, on the approval of the governor and warrant of the auditor, be paid by the State treasurer.

SEC. 17. All sums of money received by the state board of health in payment for certificates of authority to practice medicine, and all fines and special taxes, collected through and by reason of this act, shall be paid into the State treasury.

SEC. 18. Of the moneys paid into the treasury of the State under the provisions of this chapter, the sum of one thousand ($1,000) dollars is hereby appropriated to pay the salary of the secretary and to meet all the contingent expenses of the officers of the board of every kind and nature whatsoever, and should the amount thus paid into the treasury be less than one thousand dollars, the sum so paid in is hereby appropriated for the purpose aforesaid.

SEC. 19. All acts or parts of acts in conflict with this act are hereby repealed.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING MARCH 5, 1881.

ABSTRACTS FROM CONSULAR REPORTS.

BARCELONA, SPAIN.—United States Consul F. H. Schenck sends a report of mortality for the year 1880 in this city of 260,000 inhabitants. There were 7,597 deaths from all causes, giving an annual death-rate of of 29.2 per 1,000. The greatest monthly mortality was 1,113, in January; the least, 505, in June. Of the decedents, 2,290 were under one year of age; 925 from 1 to 5 years. Total under 5 years, 3,215, or 42.2 per cent. of the total deaths. There were 1,226 deaths from 10 to 60 years, and 1,361 over 60 years of age. Among the causes of death are noted: Consumption, 871; other lung diseases, 962; diarrhœal diseases, 708; typhus and typhoid fevers, 384; scarlet fever, 292; diphtheria and croup, 152; small pox, 136.

BRADFORD, ENGLAND.—United States Consul C. O. Shepard forwards a report for the week ending February 12. The births registered were 124, against 81 deaths; annual death-rate 20.8 per 1,000. Of the decedents, 31 were under 5 years of age, and 16 of these were under 1 year.

CALCUTTA.—The official report of the health officer, Surgeon-Major K. McLeod, for the last quarter of 1880, shows a registration of 2,321 births against 4,008 deaths. This mortality is considerably above the average for that season, though no epidemic disease prevailed. Among the causes of death were: Fevers 1,333, cholera 344, diarrhœa and dysentery 457, small-pox 6. Vaccination is well provided for, and out of a total of 1,207 during the quarter, 1,126 were successful, 45 failed, and in 29 the result was not known. It is proposed to establish a special vaccine station for sailors at a convenient point.

DUBLIN, IRELAND.—The report for the year 1880 is forwarded by the United States consul, giving in detail the statistics of mortality in the registration district of Dublin. The following figures are noted: Total number of deaths, 11,308; deaths under 5 years, 4,454, or 39.4 per cent. of all deaths; between 60 and 80 years of age there were 1,859 deaths, and 377 over 80 years. From zymotic diseases, there were 2,309 deaths, as follows: Small-pox 266, measles 271, scarlet fever 511, diphtheria 36, whooping-cough, 376, typhus and typhoid fevers 392, and diarrhœa 424.

FOOCHOW, CHINA.—United States Consul J. C. A. Wingate, in his weekly reports from December 25 to January 15, notes no change in the general sanitary condition, which is very good in the foreign settlement, but not so in the native city. No epidemic disease had prevailed.

HAYTI.—Weekly reports are received from Jacmel for the five weeks ending January 2. During this time there were 21 deaths, but no estimate of population is given, nor are any records kept of diseases. No contagious disease is reported.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports for the two weeks ending February 15, a total of 149 deaths in a population of 154,850; annual death-rate 25.1 per 1,000. Improvements

are being made in the drainage of Vallette. The only death from zymotic disease reported, is one from typhoid fever. Mean temperature for the two weeks, 57°.

PARIS, FRANCE.—The weekly bulletin for the week ending February 4, shows no change in the general mortality of Paris, but Dr. Bertillon notes a considerable increase of diphtheria, which balances a decline in typhoid fever. The infant mortality has also been increased by a greater prevalence of measles. Small-pox caused 33 deaths, against 41 for the preceding week.

The following reports for the week ending March 5, are from places in which burial permits are not required:

Allegheny, Pa., 78,000; deaths, 25; under 5 years, 7; accidents 1, consumption 3, croup 2, scarlet fever 1, pneumonia 2, bronchitis 1. Bath, Me., 8,000; no deaths. Belfast, Me., 5,308; deaths, 4; consumption 3. Brattleborough, Vt., 6,000; one death. Bucyrus, Ohio, 3,950; old age 1. Calais, Me., 6,162; congestion of lungs 1, under 5 years. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 6,000; deaths, 2; consumption 1, diarrhœa 1. Clinton, Mich., 1,200; no deaths. Crystal Springs, Miss., 955; one death, under 5 years. Decatur, Miss., 1,000; no deaths. Gunn City, Mo., 125; pneumonia 1. Hernando, Miss., 1,000; deaths, 2; erysipelas 1, congestion of lungs 1. Huntingdon, Pa., 4,500; puerperal 1. Indianola, Tex., 900; one death. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; deaths 2; under 5 years 1, pneumonia 1. Kenosha, Wis., 5,500; deaths, 4; under 5 years 3; consumption 1, diarrhœa 1, diphtheria 2. Lake, Ill., 18,200; deaths, 2. La Salle, Ill., 8,885; no deaths. Louisiana, Mo., 5,200; deaths, 2; congestion of lungs 1, puerperal 1. Macon, Ga., 13,800; deaths, 2; consumption 1. Madison, Ind., 9,009; old age 1. Marquette, Mich., 4,000; no deaths. Martinsburg, W. Va., 6,384; croup 1, under 5 years. Milan, Tenn., 1,260; congestion of lungs 1, under 5 years. Milledgeville, Ga., 3,000; no deaths. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,400; deaths, 3; consumption 1, scarlet fever 1. Niles, Mich., 4,200; no deaths. Painesville, Ohio, 5,500; pneumonia 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Phœnixville, Pa., 6,692; deaths, 4; under 5 years, 2; consumption 2, croup 1, diarrhœa 1. Pleasant Hill, Miss., 243; no deaths. Plymouth, Mich., 3,000; deaths, 2; diphtheria 1. Port Gibson, Miss., 1,200; one death. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; no deaths. Senatobia, Miss., 1,000; no deaths. Springfield, Ohio, 21,000; deaths, 8; under 5 years, 5; cerebro-spinal meningitis 1, consumption 2, croup 1, diphtheria 1, whooping-cough 1. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; consumption 1. Titusville, Pa., 9,000; one death. Tuscaloosa, Ala., 2,000; no deaths. Watertown, Wis., 10,000; deaths, 3; under 5 years, 2; diarrhœa 1, diphtheria 1, congestion of lungs 1. Winchester, Va., 5,000; deaths, 3; scarlet fever 1, bronchitis 1, old age 1. Youngstown, Ohio, 15,421; deaths, 5; under 5 years, 1; consumption 1, congestion of lungs 1. Total population, 298,404; deaths under 5 years, 25; total number of deaths, 87; annual death-rate per 1,000, 15.2.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports, under date of February 19, that the town continues healthy. About 140 tourists and invalids are there, most of whom are Americans.

NINGPO, CHINA.—United States Consul E. C. Lord reports for the three weeks ending January 29, no unusual sickness or mortality. Zymotic diseases prevail, especially of the diarrhœal class, with some malarial fevers.

SAMOAN ISLANDS.—United States Consul Thomas M. Dawson sends reports for the two months ending December 10. He observes that the natives are unclean in habits and surroundings, but do not seem to show an excessive mortality. The population of Apia is estimated at 40,000; there is no attempt at drainage or other sanitary measures. Leprosy prevails among the natives, and two foreigners died of that disease in 1880.

SANDWICH ISLANDS.—United States Consul F. P. Hastings, under late of February 12, sends report of the board of health, stating that varioloid first appeared in Honolulu February 5. Since that date 44 cases have occurred, with 4 deaths. Nine cases are quarantined in their houses, and 31 have been sent to the quarantine station on the reef; their dwellings have been disinfected and quarantined. The passengers by the lately arrived Chinese ship, *Mee Foo*, have been quarantined and six are in the small-pox hospital at the reef station.

SHANGHAI, CHINA.—For the four weeks ending February 5, United States Consul O. N. Denny reports great prevalence of catarrhal, pulmonary, diarrhœal, and malarial diseases. The latter were ascribed to the late dry season, leaving the muddy channels of the creeks exposed.

ST. THOMAS, W. I.—United States Consul Victor Thompson sends weekly reports from January 11 to February 19. No deaths from yellow fever had occurred during that time, but a kind of "acclimation" fever prevailed, which resembled yellow fever, and was treated in the same manner as that disease.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BURLINGTON, VT.—Dr. Geo. M. Ockford, under date of March 10, remarks that there has been but one death from scarlet fever in the past two months. During the extremely cold weather some sudden deaths occurred among aged people, and a tendency to paralytic affections was observed. Diseases of the respiratory organs have been less frequent than in former winters, probably owing to the continued cold, and absence of sudden changes of temperature, and of humidity in the air.

TARRYTOWN, N. Y.—Dr. N. H. Freeland forwards the following synopsis of the report of the board of health for the year 1880. The board was organized and entered upon its duties March 1, 1880. Since that date the following ordinances have been passed: May 26, an ordinance requesting returns of births and deaths. January 28, 1881, an ordinance requiring all cases of contagious and infectious diseases to be reported to the health officer. February 8, an ordinance making vaccination compulsory. During the year ending March 1, the village has been free from epidemics. In a locality known as Penny Bridge, 18 cases of dysentery arose from local causes, of which 7 were fatal. Seven cases of scarlet fever occurred in the deaf and dumb asylum, but all recovered. The report of mortality shows 35 deaths during the 9 months ending March 1, giving an annual death-rate of 14 per 1,000. Among the fatal diseases were, consumption 3, diarrhœal diseases 9, croup 1, bronchitis 1, accident 1. Two still-births should be deducted from the above estimate, and including these, the total number of births was 49.

TUXPAN, MEXICO.—Dr. A. M. Boyd reports for the month of January, 23 deaths, of which 4 were from consumption, 3 from pneumonia, 5 from malarial fevers, and 1 from dysentery; annual death-rate, 38.4 per 1,000. In February there were only 19 deaths: Consumption caused 2, pneumonia 3, malarial fevers 6, and epilepsy 2; annual death-rate, 31.7 per 1,000. Cold weather prevailed during the two months, causing much injury to fruit and sickness among the people

BAGDAD.—A communication dated March 11, states that a telegram has been received at the State Department, Washington, from the United States consul-general at Constantinople, reporting an outbreak of plague near Bagdad. The consul will send details to the National Board of Health by mail.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MARCH 26, 1881. [No. 39.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

PROPOSED SANITARY LEGISLATION IN PENNSYLVANIA.

The following bill is now before the legislature of Pennsylvania, to establish a State board of health, and to regulate the practice of medicine:

[AN ACT to regulate the practice of medicine, to establish a State board of health, and to make an appropriation therefor.]

SECTION 1. *Be it enacted by the Senate and House of Representatives of the commonwealth of Pennsylvania in general assembly met, and it is hereby enacted by the authority of the same*, That the governor, by and with the advice and consent of the senate, shall appoint six persons, who, with the secretary, shall constitute the State board of health. The persons so appointed shall hold office for six years, provided that the terms of office of the six first appointed shall be so arranged that the terms of two members shall expire in two years, the terms of two shall expire in four years, and the terms of two shall expire in six years. And the vacancies so created, as well as all other vacancies occurring otherwise, shall be filled by the governor, by and with the advice and consent of the senate; and provided, also, that appointments made when the senate is not in session may be confirmed at its next ensuing session.

SEC. 2. The State board of health shall have the general supervision of the interests of health and life of the citizens of the commonwealth. It shall have authority to make such sanitary investigations as it may, from time to time, deem necessary in improving the public health. It shall pass upon the competency of practitioners of medicine. It shall have the general supervision of the collection of the vital statistics of the commonwealth. It shall, at the session of the general assembly next following its creation, report for legislative action a code of sanitary laws. It shall prepare an annual report of its operations, which shall be submitted to the governor. It shall diffuse a knowledge of the means of obtaining individual and public health and of preventing disease.

SEC. 3. The first meeting of the board shall be held within fifteen days after its appointment, and thereafter in January and June of each year, and at such other times as the board shall deem expedient. The meeting in January in each year shall be in Harrisburg. A majority shall constitute a quorum. The board shall elect a secretary, who, by virtue of such election, shall be a member of the board and its executive officer. The members shall choose one of their number to be president, and they may adopt rules and by-laws for their government, subject to the provisions of this act.

SEC. 4. No member of the board, the secretary excepted, shall receive compensation, but all proper and necessary expenses of members, while engaged in the service of the board, shall be paid by the State upon the presentation of an itemized account, with vouchers annexed. The secretary shall receive an annual salary of three thousand dollars, which shall be paid in the same manner as salaries of other State officers are paid. Said board may, from time to time, engage suitable persons to render sanitary service, and to make or supervise practical or scientific investigations, and examinations requiring expert skill, and to prepare plans and reports relative thereto, but such special sanitary service shall not cost more than three thousand dollars in any one year. The total expenditures of the board shall not exceed the sum of eight thousand dollars in any one year.

SEC. 5. The sum of sixteen thousand dollars is hereby appropriated from the State treasury for the purposes of this act. The expenditures properly incurred by the authority of said board, and verified by affidavit, shall be paid by the treasurer upon the warrant of the auditor-general.

SEC. 6. The standard qualifications of a practitioner of medicine, surgery, or obstetrics in this commonwealth shall be and consist of the following, namely:

A good moral character.

A thorough elementary education.

Three years' study of medicine in its various branches under a competent preceptor.

Attendance upon two full courses of lectures in a legally-chartered medical school.

A satisfactory examination, before or on graduation, in human anatomy, human physiology, pathology, chemistry, materia medica, obstetrics, practice of medicine, surgery, and public hygiene.

A diploma received in regular manner from a chartered medical school duly authorized by law to confer upon its alumni the degree of doctor of medicine, and

A license granted as hereinafter set forth.

Every applicant for such license shall furnish to the State board of health satisfactory proof that he is possessed of the qualifications enumerated in this section. He shall deposit a copy of his diploma in the office of the court of common pleas of the county in which he may sojourn or reside, said copy to be a matter of record and open to public inspection: *Provided*, That any resident practitioner of medicine, surgery, or obstetrics, who had been in continuous practice in this commonwealth for a period of not less than five years prior to the passage of the act of assembly entitled "An act to protect the people of the commonwealth against incompetent practitioners of medicine, surgery, or obstetrics," approved the twenty-fourth day of March, A. D. 1877, shall file in the office of the court of common pleas of the county where such person intends practicing, his affidavit setting forth the time of continuous practice, and the place or places where such practice was pursued in this commonwealth. Said affidavit shall, if found by the State board of health to be correct and true, be deemed sufficient evidence of qualification to practice medicine, surgery, or obstetrics, and said board shall issue the license hereinafter provided for.

SEC. 7. The State board of health shall examine every diploma or affidavit of competency recorded and filed in the offices of the said courts of the various counties; and said board shall be the judge of the genuineness of said diploma, and of the truth of said affidavit of competency. If said diploma or affidavit of competency be found genuine and true, and if the person therein named be the person applying for a license to practice medicine, the State board of health shall issue such license, which shall be conclusive evidence of the right of the lawful holder of the same to practice medicine in this commonwealth. In addition to the persons already mentioned as entitled to such license, any person who shall submit himself to such examination as the said board may require, and who shall pass an examination satisfactory to the examiners, under such restrictions and regulations as the board may prescribe, shall receive a license

from said board of health to practice medicine, surgery, or obstetrics, and shall be entitled to all the rights and privileges herein mentioned. The officers of said board shall have authority to administer oaths and to take testimony in all matters relating to their duties. Said board shall furnish to the prothonotaries of the several counties a list of all persons receiving its license. Said board shall have power to refuse or revoke its licenses for just and proper cause.

SEC. 8. It shall be unlawful, on and after the first day of January, A. D. 1882, for any person not qualified and licensed by the State board of health, according to the sixth and seventh sections of this act, to practice medicine, surgery, or obstetrics, or to collect any fees for medical, surgical, or obstetrical services.

SEC. 9. Candidates for examination by the State board of health shall pay a fee of five dollars, which shall be returned to them if licenses be refused. Examinations may be made, in whole or in part, in writing, and shall be of an elementary and practical character, but sufficiently strict to test the qualifications of the candidate as a practitioner.

SEC. 10. Any person shall be regarded as practicing medicine within the meaning of this act who shall profess publicly to be a physician, or to prescribe for the sick, or who shall append to his name the letters "M. D.;" but nothing in this act shall be construed to prohibit gratuitous services in cases of sudden emergency. And this act shall not apply to commissioned surgeons of the United States Army and Navy.

SEC. 11. Any itinerant who shall sell any drug, nostrum, ointment, or agency of any kind intended for the treatment of disease or ailment, or who shall, by writing or printing, or by any other method, publicly profess to cure or treat disease, injury, or bodily ailment whatsoever, shall pay a license of one hundred dollars a month, to be collected in the way now prescribed by law for pedlars.

SEC. 12. It shall be the duty of practitioners of midwifery in this commonwealth to register their names and post-office address in the office of the court of common pleas of the county where they reside, and said practitioners of midwifery shall be required, under penalty of ten dollars, to be recovered in any court of competent jurisdiction in the commonwealth, to report to the prothonotary of said county within thirty days of their occurrence, all births and deaths which may come under their supervision, with a certificate of the cause of death and such correlative facts as the board may require.

SEC. 13. It shall be the duty of all health officers and boards of health in the State, all officers of the State, the physicians of all incorporated companies, or the president or agent of any company or institution, chartered, organized, or transacting business under the laws of this commonwealth, so far as is practicable, to forward to the State board of health any information bearing upon public health which may be requested by said board.

SEC. 14. Any person who shall offer for record a copy of any diploma to practice medicine which shall have been issued to any other person, or shall offer for record a diploma or affidavit of competency issued or obtained fraudulently, or in violation of the laws of this commonwealth, or in violation of the charter of the institution conferring said diploma, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than three hundred dollars nor more than five hundred dollars, or imprisonment at hard labor for not less than one nor more than three years, or both, at the discretion of the court, and his license shall thereby be revoked. And any person who shall in any other respect violate or fail to comply with the provisions of this act shall be deemed guilty of a misdemeanor, and on conviction, before any court of competent jurisdiction, shall be sentenced to pay a fine of not less than two hundred dollars nor more than four hundred dollars for each and every offense, for the use of the county wherein such misdemeanor is committed, and his license shall thereby be revoked.

SEC. 15. All acts or parts of acts inconsistent herewith be, and the same are hereby, repealed.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HARTFORD, CONN.—Dr. C. W. Chamberlain, secretary of the State board of health, forwards a copy of his report for the month of January, and a pamphlet issued by the board of health, giving instructions relating to the restriction and prevention of small-pox. The remarks on vaccination are quoted from Hart; the directions as to disinfection are practical, and carbolic acid and chloride of lime are abandoned for sulphur and solutions of zinc and iron. The treatise closes with brief but plain directions for the construction of a pest-house, and the proper disinfecting arrangements connected therewith. The monthly report shows but one death in January from small-pox (in Hartford), 3 from scarlet fever, 3 from typhoid fever, and 4 from measles. Notice is taken of 3 deaths in Hartford and 2 in Meriden from malarial fevers, as indicating an unusual prevalence of such diseases for the season. Two cases of severe poisoning from aniline dyes were investigated; one was from wearing blue wristlets, the other from red-lined mittens. The eruptions were characteristic and severe, but involved only the hands and a portion of the arms.

NEW YORK—Dr. John T. Nagle, health officer, forwards the following report of mortality in that city for the last quarter of 1880:

I have the honor to state that the mortality of this city during the three months ending December 31, 1880, was unusually high, having been 1,740 above the average deaths for the corresponding three months of the past nine years. The annual death-rate to every 1,000 inhabitants (United States census, taken in June, 1880, 1,206,577) was 26.75. The deaths from all the five classes of diseases showed a large increase during the quarter ending December 31, 1880, compared with the number that occurred during the corresponding quarters of the past five years. The mortality for the fourth quarter of 1880 was 8,068, against 6,474 for the corresponding quarter of 1879. More than 60 per cent. of the deaths during the fourth quarter of 1880 were from the following nine diseases, viz: Phthisis pulmonalis, 1,266; pneumonia, 800; bronchitis, 433; diphtheria, 647; Bright's disease and nephritis, 404; croup, 379; scarlatina, 341; diarrhœal diseases, 299, and diseases of the heart, 300. The greatest reduction in the number of deaths from any disease was from diarrhœal complaints, which were 1,872 lower than the number reported during the preceding quarter.

The deaths from zymotic diseases during the third quarter of the year exceeded the deaths of any of the other classes by 752, but the deaths during the fourth quarter of the year from the local class of diseases exceeded those of any of the other classes by 945. Compared with the corresponding quarter of 1879, the deaths from zymotic diseases showed an increase of 833; from constitutional diseases, 173; from local diseases, 424; developmental diseases, 96, and from violence, 68; and, compared with the preceding quarter, the deaths from zymotic diseases decreased 1,050 and violence 17, while the deaths from constitutional diseases increased 24, local diseases 647, and developmental diseases 41.

The increase in the number of deaths during the 4th quarter of the year 1880, compared with the corresponding quarter of 1879, is as follows: Small-pox 24; scarlatina 234; diphtheria 429; croup 152; typhus fever 1; typhoid fever 22; puerperal diseases 44; diarrhœal diseases 4; alcoholism 10; cancers 26; phthisis pulmonalis 129; bronchitis 62; pneumonia 91; diseases of the heart 40; marasmus and scrofula 2; hydrocephalus and tubercular meningitis 14; meningitis and encephalitis 31; convulsions 17; Bright's disease and nephritis 66; suicide 8, and drowning 3; while the following diseases showed a decrease, viz: Measles 101; whooping-cough 15, and apoplexy 19. The deaths of children under 5 were 3,294, against 2,664; the number that died during the corresponding quarter of 1879, and the deaths of persons 70 years and upward, were 601 against 485 that died during the corresponding period of last year.

The number of cases reported to the sanitary bureau during the 3 months ending December 31, 1880, of small-pox was 59, measles 266, scarlatina 1,550, cerebro-spinal fever 39, diphtheria 1,683, and typhoid fever 194. The number of cases of small-pox reported for every death from that disease was 2.36, measles 15.64, scarlatina 4.55, diphtheria 2.60, and typhoid fever 2.49.

The total number of deaths in tenement houses was 4,445, in houses containing less than 4 families 2,021, in hotels and boarding houses 86, in rivers, streets, boats, &c., 90, in institutions 1,362, and the balance were in dwellings the variety of which was not stated.

The mean meteorological observations for the quarter as furnished by D. Draper, director of the meteorological observatory at Central Park, are as follows, viz: In October the mean temperature Fahr. was 53.62, November 38.72, December 26.53. The mean pressure (barometric) in October was 29.969, in November 30.083, in December 29.854. The mean humidity (saturation being 100) was 81 in October, 82 in November, and 90 in December; the number of miles traveled by the wind was 5,172 in October, 5,501 in November, and 7,270 in December. The total rainfall was 2.81 inches in October, 2.46 in November, and 2.27 in December. The mean temperature Fahr. for the 4th quarter of 1880 was therefore 4.07 degrees lower, the mean pressure .057 lower, the mean rainfall .03 lower; the mean humidity was 4 higher, and the number of miles traveled by the wind was 4,532 greater than during the corresponding quarter of 1879.

Deaths in New York City, by quarters, for the past ten years, ending December 31, 1880.

SANITARY LEGISLATION IN NEW YORK.

The following act relating to vital statistics was passed May 29, 1880:

The people of the State of New York, represented in senate and assembly, do enact as follows:

SECTION 1. Chapter four hundred and eighty-two of the laws of eighteen hundred and seventy-five, entitled "An act to confer on boards of supervisors further powers of local legislation and administration, and to regulate the compensation of supervisors," is hereby amended by adding thereto the following additional subdivisions to section one of said act:

* * * * * * *

REGISTRATION OF MARRIAGES, BIRTHS, AND DEATHS.

31. To provide for the registration, in the clerk's office in each town and village in the county, of every marriage, birth, and death which may occur in said town or village; such registration to be made upon the report, within three days of the event, of the attending clergyman, magistrate, or physician. Such registration to be made in books of record, properly bound, lettered, paged, ruled, printed, indexed and prepared for the purpose, and furnished whenever necessary, and upon a written demand of the said clerk, by the board of supervisors to each town or village; the expense of which books shall be a proper county charge, to be paid for as a charge in the general expenses of the county. Such books shall be so ruled and printed that sufficient space shall be had between the lines and columns of each page thereof to clearly and fully record the date, name, residence, locality, giving the street and number if possible, age, and disease of each person dying; and the name or names, color, age and nationality of every person married, and the date thereof; and the name or names of the parent or parents, together with the sex, color, date and place of birth of each child so born.

32. To provide by ordinance, rule, resolution, or regulation for the non-removal of any dead body to any place without the limits of the said county, or to prevent the bringing to or within the limits of said county of any dead body by any railroad or steamboat corporation, or by any express company or common carrier, or by any other person or persons or corporations whatsoever; or the burial or interment of any dead body within the said county without a burial permit first being had and obtained; such permit to be based upon a medical certificate of the cause of death, or upon a coroner's inquest, or, in case where no medical certificate can be obtained, and no coroner's inquest has been held or required by law, such permit may be granted upon affidavit, duly verified by some person or persons known to the officer granting such permit, stating the circumstance, time, and cause of death, as nearly as the same can be ascertained, and to be issued by the clerk or a justice of the peace or police justice of the town or village in which such death occurs, or where such burial or interment is to be made, and to be recorded by him. To provide books and blank forms of permits and of medical certificates, properly printed and ruled for use for such purposes as aforesaid, and to be furnished and paid for as is provided for the books required in the next preceding section hereto. Such books and such permits shall, in each case, contain the name of the person or corporation to whom such permit of removal or of burial is given. Any willful non-observance or disobedience of any rules, ordinances, regulations, or resolutions of said board of supervisors, made in accordance with the powers hereby granted, shall be deemed a misdemeanor, and be punishable as such.

33. To fix the amount and provide for the payment of the registration fees in all such cases as aforesaid, and to provide for obtaining copies of such records and for the amount and payment of fees for such copies. Such copies duly attested by said town or village clerk shall be admitted in all the courts of this State as *prima facie* evidence of the facts therein set forth.

* * * * * *

35. To provide for and use all necessary means for the prevention of and to prevent the spread of all infections and contagious diseases, and for the payment of all expenses necessarily incurred therefor.

SEC. 2. This act shall take effect immediately.

STATE OF NEW YORK,
Office of the Secretary of State, ss:

I have compared the preceding with the original law on file in this office, and do hereby certify that the same is a correct transcript therefrom and of the whole of said original law.

JOSEPH B. CARR,
Secretary of State.

Under the powers conferred by the above act the board of supervisors of Westchester County have adopted rules and regulations for securing a proper record of marriages, births, and deaths within their jurisdiction.

ABSTRACTS FROM CONSULAR REPORTS.

COPENHAGEN, DENMARK.—The Department of State forwards the following translation of a notice issued by the Danish Government relating to certain ports infected with yellow fever:

The provisions contained in section 2 of the law relating to precautions against the introduction of infectious diseases into the kingdom are to be enforced on the 2d day of July, 1880, and to remain in force until further notice, as regards vessels coming from the ports of Caracas, La Guayra, and Porto Cabello; also, concerning the prohibition to import articles from the above-named ports, &c.

In view of the fact that, according to advices received, numerous cases of yellow fever have occurred in the said cities, the following provisions are hereby established until further notice, in connection with the law concerning precautions against the introduction of infectious diseases. These provisions are to take effect July 2, 1880, and to remain in force until further notice:

1. The provisions contained in section 2 of the aforesaid law are to be enforced in the case of vessels coming from, or having had dealings with, the ports of Caracas, La Guayra, or Porto Cabello, or in the case of those which on their passage have received persons from, or sent persons on board of, such a vessel.

2. The importation into the kingdom from the aforesaid ports of linen that has been used, wearing apparel that has been used, and bed-clothes that have been used, provided such articles do not belong to the baggage of persons, is hereby forbidden. Linen, wearing apparel, and bed-clothes brought from the aforesaid ports as baggage shall be cleansed under proper supervision.

The cleansing referred to in the foregoing paragraph shall, if possible, take place in a disinfecting oven, in which the articles to be disinfected shall be subjected to a heat of 120° Celsius (248 Fahr.). In default of such an oven, or if such a one cannot be used, the articles shall be fumigated for six hours with sulphur, five grams of which for each cubic yard shall be burned in a tightly-closed space.

HAVANA, CUBA.—During the week ending March 12, one death from yellow fever and 21 from small-pox are reported.

RIO DE JANEIRO, BRAZIL.—The reports of United States consul T. Adamson, for the two weeks ending February 12, give 35 deaths from yellow fever and 2 from small-pox. Yellow fever is slowly increasing, but is not yet considered epidemic, and the port is regarded as unusually free from fevers, for the season of the year.

The following reports for the week ending March 12, are from places in which burial permits are not required:

Allegheny, Pa., 78,000; deaths, 29; under 5 years 15, accident 1, cerebro-spinal meningitis 1, consumption 1, typhoid fever 2, scarlet fever 5, pneumonia 3, bronchitis 1, measles 1. Bath, Me., 8,000; death, 1; congestion of lungs 1. Belfast, Me., 5,308; deaths, 3; consumption 2, pneumonia 1. Brattleborough, Vt., 6,000; death, 1; under 5 years 1. Bucyrus, Ohio, 3,950; death, 1. Calais, Me., 6,162; death, 1; under 5 years 1. Carrollton, Miss., 600; no deaths. Chillicothe, Ohio, 11,000; deaths, 5; under 5 years 1, accident 1, consumption 2, erysipelas 1, measles 1. Circleville, Ohio, 5,996; no deaths. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 3; under 5 years 1, pneumonia 2. Corinth, Miss., 2,264; death, 1. Crystal Springs, 955; no deaths. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; death, 1. Hernando, Miss., 1,000; no deaths. Huntingdon, Tenn., 1,200; no deaths. Huntingdon, Pa., 4,500; deaths, 2; scarlet fever 1, pneumonia 1. Iuka, Miss., 816; deaths, 1. Jefferson, Tex., 3,251; no deaths. Louisiana, Mo., 5,200; deaths, 2; under 5 years 1, congestion of lungs 1, puerperal 1. Madison, Ind., 9,009; deaths, 4; consumption 1, bronchitis 1. Marquette, Mich., 4,030; deaths, 2; puerperal 1. Martinsburg, W. Va., 6,384; deaths, 4; under 5 years 2, accidents 2, typhoid fever 1. Meridian, Miss., 4,013; death, 1. Milan, Tenn., 1,800; deaths, 2; pneumonia 1, puerperal 1. Milledgeville, Ga., 3,000; no deaths. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; deaths, 5; under 5 years 1, consumption 2, scarlet fever 2. Niles, Mich., 4,200; death, 1. Painesville, Ohio, 5,504; no deaths. Pass Christian, 1,500; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; death, 1; under 5 years 1, pneumonia 1. Port Gibson, Miss., 1,200; no death. Rensselaer, Ind., 900; death, 1; under 5 years 1, measles 1. Senatobia, Miss., 935; death, 1; bronchitis 1. Starkville, Miss., 1,454; death, 1; lung disease 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; no deaths. Winchester, Va., 5,000; deaths, 2; scarlet fever 2. Youngstown, Ohio, 15,421; deaths, 5; under 5 years, 2; typhoid fever 1, pneumonia 2, bronchitis 1. Total population, 245,303; deaths under 5 years, 27; total number of deaths, 81; annual rate per 1,000, 17.2.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, APRIL 2, 1881. [No. 40.

SANITARY COUNCIL OF THE MISSISSIPPI VALLEY.

The third annual meeting of the Sanitary Council of the Mississippi Valley will be held at Evansville, Ind., on April 20. Important business will be transacted. The status of quarantine will be discussed, and report made of a schedule of articles and the circumstances under which they can be transported without conveying infections or contagions from one point to another. All State or local boards of health and sanitary organizations in the Valley of the Mississippi are invited to be represented; also, representatives of the railway and steamboat interests, especially of the Lower Mississippi.

SMALL-POX AND PLAGUE IN THE EAST.

CONSTANTINOPLE.—Under date of March 7, United States Consul G. H. Heap sends the following report of epidemic diseases in that city and in Persia:

An epidemic of small-pox has prevailed in Constantinople and the neighboring towns for some time past. Its principal ravages have been among the refugees from other provinces, vaccination being scarcely known to them; but the government has lately taken measures in its usual feeble way to cause them to submit, which they do very unwillingly, to this precaution. It is believed that the disease is now on the decline. A report from Dr. Matteosian, the delegate of the United States to the International Sanitary Council, dated the 3d instant, copy of which is inclosed, gives the mortality from this cause to the 25th of February last.

A more serious epidemic has made its appearance in the towns of Djaara and Nedjef, in the Bagdad district, as will be seen by the letter of Dr. Matteosian, dated the 5th instant, copy inclosed. It would appear that there were thirty deaths from the plague at Djaara in thirteen days, from the 3d to the 15th of February, and eighteen at Nedjef in three days. I do not know the population of these places, but that of Djaara is inconsiderable.

Dr. Matteosian states that precautions have been taken to localize the epidemic. Whether these measures will be effectual remains to be seen. The virulence of this dreaded disease, and the panic it causes, will make it difficult to prevent its spread.

Dejaara is a small place near Bagdad. Nedjef, or rather Meshed-Ali, "Shrine of Ali," where Ali, the principle disciple of Mahomet, was buried, is a place of pilgrimage of equal sanctity almost as Mecca to the Persians. The population varies considerably, according to the afflux of pilgrims at certain seasons, and it has seen several outbreaks of plague in recent years.

An epidemic of this character reaching Constantinople, crowded as it is with refugees in every stage of misery, will make great ravages.

The pilgrimage to Mecca has been accomplished this year with an unusual absence of mortality or disease, considering the great number of pilgrims from every part of the Mahometan world. Strict sanitary measures were taken to prevent the recurrence of cholera and other epidemics. Aqueducts which had fallen into disrepair were restored, and severe rules were adopted in regard to the slaughter of sheep, ten thousand of which are sometimes required for the daily supply of the multitude.

With the letter are forwarded the following reports from Dr. H. B. Matteosian, delegate of the United States to the International Sanitary Council, which acts as a general board of health:

PERA, *March* 3, 1881.

I have the honor to communicate the following communications in regard to the epidemic of small-pox, which has prevailed in Constantinople lately, and of which I have already informed your excellency.

The epidemic commenced about the beginning of the present year. It has prevailed chiefly in Pera and in the quarter extending from Top-hané, Galata, to Azab-Kapon, though many parts of the city and its environs have not been free from isolated cases. There have not been any cases in the numerous military hospitals, but more or less cases were admitted into the greater part of the civil hospitals.

It has been impossible to ascertain the total number of cases, but the total number of deaths in hospitals and in the city put together, from 13th of January to 25th of February, 1881, has been 86, according to the number of burial permits. Apparently, there is a decline in the epidemic, for no cases have been reported during the last week.

While the epidemic was at its height, by the decision of the International Sanitary Council, notice was given in the bills of health in regard to the existence of the epidemic in Constantinople. Now, according to the decision of the same council, the fact of its decline is notified.

PERA, *March* 5, 1881.

I have the honor to inform you that I have this evening received the copy of a telegram sent by Dr. Zitterer, the inspector of Bagdad, who was charged to inspect and ascertain the nature of the disease which was reported to prevail in the village of Djaara, and supposed to be the plague.

He made the necessary inspections and ascertained that it was really the plague. From the 3d to the 15th of February there have been 30 deaths in the same village. The disease was also carried to Nedjef, which is not very distant. There have been 18 deaths in three days.

He has placed the localities visited by the disease under quarantine, and has taken measures to localize the epidemic.

A consular communication of March 9, incloses a letter from Dr. Matteosian dated March 8, stating that a special meeting of the International Sanitary Council had been called March 7 to consider the outbreak of plague in the province of Bagdad. Telegrams were presented from Dr. Zitterer, sanitary inspector of Bagdad, of the following dates and purport:

March 2. On February 24, visited the places reported as infected. Cases examined at Nedjef proved to be true plague (*peste bubonique*); the disease appeared first near Djaara among the nomadic Bedouins, and from February 3 to 15 caused 30 deaths in that vicinity. In three days it reached Nedjef, and 18 persons have died there. On account of the frequent communication between the infected places and Karbella an inspector has been sent to the latter place. A strict *cordon* has been established around all infected towns, and a quarantine of 15 days imposed upon all vessels passing from them on the Euphrates; the same has been ordered to be done at the frontier stations.

March 3. Pilgrims from Nedjef to Karbella have been stopped. The guards are insufficient to maintain quarantine, and the government is called on for immediate aid in soldiers and in tents and provision for those detained in quarantine.

In compliance with the recommendation of the council the prime minister, M. Bartoletti, issued an order dated March 8, directing the proper authorities to give all the aid required to carry out the sanitary measures of the council.

SAINT MARY'S, GEORGIA.—Dr. A. F. Barnard reports under date of March 18, for the three months ending at that time, January 30, the English bark *Madras* arrived from Saint Thomas, having lost one seamen on the voyage, who was said by the officers to have died from intemperance. Small-pox prevailing in the hospital at the port of departure, the bark was detained for fumigation, although no sickness was found on board.

NOTE.—In printing the diagram on page 737, Bulletin No. 38, the number 10 was omitted at the end of the base line. The dark columns show the excess of the death-rates over 10, which is taken as a basis.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING MARCH 19, 1881.

Cities and States.	Total population, according to the United States census of 1880.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Population, according to United States census of 1880.		Number of deaths.		Annual death-rate per 1,000.		Population under 5 years. ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough, in his reports from January 8 to February 5, states that the city is in its usual filthy and unsanitary condition, but remains free from epidemic disease. The weekly mean temperature ranged from 54 January 15 to 65 February 5.

BOMBAY, BRITISH INDIA.—United States Consul B. F. Farnham, under date of February 17, forwards the annual report, for 1880–'81, of the Grant Medical College. This institution was proposed and earnestly advocated by the former governor, Sir Robert Grant, who died in 1838. It was then resolved to build and endow the college as a memorial of his efforts, and the course of instruction was begun in 1845. Hospitals were soon added, and the college was recognized by the authorities in England, many of its graduates entering the government service. The subsequent founding of the University of Bombay took from the college the right of granting diplomas, but its students are examined for degrees by the teachers of the college in conjunction with those of the university.

The native students have generally shown much aptness for their studies, and have often graduated with distinction. The teaching was at first gratuitous, but since 1872 fees have been levied, and the course of five years now costs about the same as in most European colleges. There are now flourishing medical colleges at Calcutta, Bombay, and Madras.

CAPE HAYTIEN, HAYTI.—United States Consul S. Gontier, under date of February 28, reports the arrival of the American bark *Shooting Star* from Alicante, Spain, January 3. The vessel went to Fort Liberty to collect a cargo of logwood for Havre, France. While there, the captain's wife and four seamen were taken with the (yellow?) fever; two of the sailors recovered and continued the voyage, the other patients dying of the fever. The disease was confined to the ship, no other cases being reported. Small-pox has appeared at Puerto Plata and in St. Thomas, but vessels from those places are allowed free pratique. Cape Haytien continues, however, one of the healthiest ports in the island.

DEMERARA, GUIANA.—The reports for the city of Georgetown show 201 deaths in November and 211 in December, 1880; the births corresponding were 144 and 176. The population not having been estimated since 1871, a death-rate based upon it would have no value at present. In each month, 4 deaths from leprosy are noted. Consumption caused 67 out of the total of 415, being 16 per cent., or very little more than the usual ratio in the United States.

FOOCHOW, CHINA.—The reports of United States Consul J. C. A. Wingate, from January 21 to February 5, show no change in the condition of the city, and no epidemic disease exists. Mean temperature 55°.

HAVRE, FRANCE.—United States Consul J. A. Bridgland, in his report of February 26, refers to a recent order, issued by the minister of agriculture and commerce, restricting the importation and use of American pork on account of alleged infection with trichina. The consul states that no pork so affected has been found in his district, nor does he believe such has been found elsewhere in France. He states that our own people are in greater danger from the use of wines exported from France, which are so adulterated as to be unfit for use.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports that during the three weeks ending March 12 the town has remained perfectly healthy, and is in excellent condition as to drainage and cleanliness.

NINGPO, CHINA.—United States Consul E. C. Lord sends reports from January 29 to February 12. Typhoid and scarlet fevers, measles, and whooping cough are said to be common among the natives, but no statistics are kept. Small-pox is now increasing, owing to the custom of inoculating children at this season. Mean temperature 49°.

SANTIAGO DE CUBA.—United States Consul J. C. Landreau, in his report for the month of February, notes yellow fever 12 cases and 9 deaths; small-pox, 10 cases and 6 deaths; and typhoid fever, 11 cases and 6 deaths. Total deaths, 103; population, 89,000; annual death-rate, 33.5 per 1,000. The yellow fever was mostly among the Spanish troops. The port remains healthy, and clean bills are still issued to vessels bound to United States ports.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic or contagious diseases up to February 7.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING MARCH 19, 1881—Continued.

SWATOW, CHINA.—This city, in the consular district of United States Consul J. C. A. Wingate, is reported under date of January 22 to be in the usual unclean condition, excepting the foreign settlement. No epidemic disease has existed of late.

TUNIS, AFRICA.—Under date of March 2 United States Consul George W. Fish gives the following account of the city and regency of Tunis:

The year 1880 has been marked by agricultural and financial prosperity. Although the summer heats were protracted and severe, the country was exempt from epidemic and endemic diseases; there have been no alarms on account of contagious diseases, nor has any unusual sickness prevailed. During the extreme heat of summer there is generally very little sickness, and but few deaths occur. Sunstroke is seldom heard of in this country, and never among the native population. The autumn rains bring an increase of sickness and mortality. Lung diseases are apt to assume the *typhoid* form, and diphtheria is observed among the children, while fevers of typhoid type prevail. The city has an estimated population of about 150,000, of whom 30,000 are Jews, about 20,000 Christians, and the remainder Mohammedans, divided between Moors, Arabs, and Negroes, in unknown proportion. No reports of mortality can be obtained from the native authorities, but through the courtesy of the Roman and Protestant clergy a record of interments has been obtained. This shows a total of 263 deaths among the Christian population, giving an annual death-rate of 13.1 per 1,000. This rate may probably be taken as a fair average for the whole population, being somewhat higher among the Jews and lower among the Mohammedans. The climate is remarkably equable during the winter; the temperature for January and February of 1881 varied only between 57 and 60 degrees

VALPARAISO, CHILI.—United States Consul L. H. Foote sends a report for the month of December, giving a total of 509 deaths, in a population of 101,088; annual death-rate, 59.2 per 1,000. There were 61 deaths from consumption, 148 from other lung diseases, and 179 from fevers.

For the month of January, 524 deaths are reported, giving an annual mortality of 61 per 1,000. Small-pox has again appeared and caused 35 deaths, consumption 44, other lung diseases 82, and fevers 167.

The following reports for the week ending March 19, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 75,000; deaths, 29; accident 1, consumption 2, diphtheria 3, typhoid fever 1, scarlet fever 7, pneumonia 2. Bath, Me., 7,000; deaths, 2; consumption 1. Belfast, Me., 5,308; death, 1. Brattleborough, Vt., 6,000; death, 1; consumption 1. Bucyrus, Ohio, 3,950; deaths, 3. Calais, Me., 6,162; no deaths. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 5,936; death, 1; consumption 1. Clinton, Mich., 1,200; death, 1; under 5 years 1. Columbus, Ga., 10,000; deaths, 2; under 5 years 1, croup 1, diarrhœa 1. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 955; no deaths. Decatur, Miss., 1,000; no deaths. Gunn City, Mo., 125; death, 1; under 5 years 1, measles 1. Hernando, Miss., 1,000; deaths, 2; consumption 1, puerperal diseases 1. Huntingdon, Tenn., 1,200; no deaths. Huntingdon, Pa., 4,500; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,251; deaths, 2; pneumonia 2. Kenosha, Wis., 5,500; death, 1. Louisiana, Mo., 5,000; deaths, 2; under 5 years 2, pneumonia 1, whooping cough 1. Madison, Ind., 9,003; deaths, 4; under 5 years 1. Martinsburg, W. Va., 6,334; deaths, 3; under 5 years 2, accident 1, typhoid fever 1. Meridian, Miss., 4,013; deaths, 2; consumption 1, pneumonia 1. Milan, Tenn., 1,800; deaths, 2; consumption 1, pneumonia 1. Milledgeville, Ga., 3,000; deaths, 2; puerperal 1. Mount Pleasant, Iowa, 4,500; no deaths. Muscatine, Iowa, 8,412; deaths, 2; consumption 1, malarial fever 1. Niles, Mich., 4,200; no deaths. Painesville, Ohio, 5,504; deaths, 2; under 5 years 1, pleurisy 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; death, 1; measles 1. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, 5,000; deaths, 2; under 5 years 1, diphtheria 1. Springfield, Ohio, 21,000; deaths, 8; under 5 years 3, cerebro spinal meningitis 1, consumption 1, pneumonia 2. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; death, 1; under 5 years 1. Titusville, Pa., 9,046; death, 1; consumption 1. Tuskaloosa, Ala., 2,000; no deaths. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; deaths, 2; under 5 years 1, congestion of the lungs 1. Winona, Minn., 10,000; death, 1; under 5 years 1, diphtheria 1. Youngstown, Ohio, 15,421; deaths, 6; under 5 years 3, diarrhœa 1, typhoid fever 2, pneumonia 2, bronchitis 1. Total population, 275,463; deaths under 5 years, 19; total number of deaths, 87; annual rate per 1,000, 16.4.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BUCYRUS, OHIO.—Dr. W. B. Carson, under date of March 21, reports that since last December an epidemic of *influenza* has prevailed. Most of the people were affected, but few cases required medical treatment, unless bronchial or pharyngeal inflammation appeared. The duration of the attacks was usually from four to fourteen days.

CHARLESTON, S. C.—Under date of March 21, Dr. F. P. Porcher reports a form of *influenza* prevailing. The symptoms are, some fever, catarrh, almost constant cough, some pains in the limbs, but not so marked as in the dengue fever of last summer; there is usually headache, with redness of the tongue, and not unfrequently vomiting. The fever is sometimes high, but the prostration following is not very decided. The eruption of dengue is wanting, but in two cases swelling and suffusion of the face have been observed. The disease has extended to Columbia and elsewhere, and has affected a large number of persons, white and colored, throughout the lower portion of the State. Scarlet fever exists in the city at present, and very rarely a case of diphtheria is seen. The children in the public schools are being vaccinated, though there is at present no small-pox in the State.

HAVANA, CUBA.—During the week ending March 18, there were 23 deaths from small-pox. No deaths from yellow fever were reported, but a few cases of that disease are known to exist.

HUDSON, N. Y.—Dr. George P. Salmon, health officer, writes under date of March 21 that 11 cases of small-pox have occurred since January 31, in this city of about 9,000 inhabitants. Five deaths have been reported, and four cases are still under treatment, which it is hoped will recover. Scarlet fever of a mild type has also prevailed to some extent.

VERA CRUZ, MEXICO.—The official report for the month of January gives 28 deaths from yellow fever, of which 19 were in the first two weeks. Small-pox caused 9 deaths, consumption 16, other lung diseases 16, diarrhœa 5, dysentery 4, malarial fevers 2. Total number of deaths, 123; population, 20,000; annual rate, 72.3 per 1,000.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, APRIL 9, 1881. [No. 41.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—During the week ending March 25, no deaths from yellow fever were reported, and only 4 cases were known to exist in the city. There were 29 deaths from small-pox, and 8 from typhoid fever during the week.

LAKE, ILL.—Dr. A. L. Cory, deputy commissioner of health, sends reports of deaths from January 1 to February 26. For the four weeks ending January 29, there were 28 deaths; consumption 2, other lung diseases 8, croup 1, diphtheria 3, scarlet fever 3, typhoid fever 1, puerperal 1, accidents 2. For the four weeks ending February 26, there were 30 deaths; consumption 1, other lung diseases 8, diphtheria 2, malarial fever 1, whooping-cough 1, puerperal 2, diseases of the brain 4, accident 1. The population being estimated at 18,200, the annual death-rate for January was 20.1, and for February 21.5 per 1,000. During the week ending January 29, a case of small-pox occurred, and another in the last week of February; both were removed to the hospital in Chicago, and died there. From March 5 to March 26, five cases were reported, of which two died in the town.

PASS CHRISTIAN, MISS.—Dr. Charles Le Roux, under date of March 1, submits the following report on this town and vicinity:

Pass Christian is situated in Harrison County, Mississippi, in latitude 30° 20′ north, 58 miles from the city of New Orleans and 83 from Mobile, on the New Orleans and Mississippi R. R.

Its altitude above sea-level ranges between 15 and 25 feet.

In the year 1800 there were here but few families, consisting of foreigners, descendants of the original French settlers in Louisiana. The town was incorporated in the year 1848 with a front on the Gulf of 4½ miles. Since that time the settlement has been extended back to an average depth of three-quarters of a mile. In 1860 the resident population was about 1,500; it is now about 2,000; two-thirds of whom are natives, one-sixth Europeans, and one-sixth negroes. But during the summer our population is increased to about 5,000

No meteorological observations were ever recorded in this city, as far as known. But it can safely be stated that during the winter the thermometer very rarely falls below 30° Fah., or rises above 75°; whilst in the summer it seldom reaches 90.

We can, therefore, boast of a climate particularly adapted to invalids who dread either extreme of temperature and of an atmosphere perfectly free from malaria. No place in the United States is better suited for a first-class sanitarium.

Pass Christian is built on a high ridge fronting the Gulf of Mexico, and within a few feet only of its waters. This ridge gradually declines towards the rear on the north and west sides, where there are marshes at an average distance of 5,000 feet. But these marshes act as drains, having high land on each side of them, and are subject, besides, to the daily overflow of the salt-water tide.

About three miles back the ground begins to be undulating. A little further it becomes hilly, and continues more and more so as one proceeds further north.

One of the nearest elevations is at a place called Bluffville, distant six miles, due north, from our town. It is about 50 feet higher than the waters of Wolf River, which it fronts.

On the other side of this river, and of other water courses, the hills rapidly increase in height for 150 miles.

The lowest point back of the town is about 20 feet lower than the highest ground in front.

During the day, and especially in the summer, we are constantly fanned by a pure and cool sea breeze; whilst during the night, the north breeze coming from the rear, where we are protected by a dense forest of fine pine timber, reaches us loaded with the aroma of turpentine.

This air, besides being perfectly free from all miasma, contributes to make of this place, perhaps, the healthiest in the United States. Northern invalids say that they prefer this climate to that of Florida, because, in the winter, it is somewhat cooler than some portions of that State, and consequently less enervating, whilst they never suffer here from extreme cold; and our atmosphere, free from malaria and rich in ozone, invigorates their enfeebled systems.

Pass Christian has no regular market garden within its corporate limits. But each residence has its own garden attached. As the land is generally poor and sandy, this is not considered a farming country. We count about 350 houses in our town, some of them lovely residences, and all well ventilated and in perfect sanitary condition. Two public schools, one for white and the other for colored children; two cemeteries, one Protestant, the other Roman Catholic. These grounds are well drained, and no sickness ever took place in the neighborhood that could be attributed to the proximity of the graves. The bodies are usually buried in the soil at a depth varying between 6 and 10 feet; some few in brick vaults, above ground and well cemented on the outside. On an average we hardly witness half a dozen deaths in the year; no burial certificate is required, we having no law to that effect. As to health laws, the registration of deaths, births, and diseases we are governed by our State laws, not always strictly complied with however; but we have no municipal laws in connection therewith. We have no board of health in our town; but there is one in the county which meets once a month between the 1st of May and the 1st of November in Mississippi City. Our county board of health is composed of five members; two regular physicians, one lawyer, and two merchants. They are elected by the county board of supervisors, and their term of service is four years. A small tax is levied on the people of the county to defray the expenses of said board of health. Within the last two years, its members have unanimously adopted the rules and regulations of the National Board of Health, and agreed to act in concert with it to the full extent of their power in all matters concerning quarantine and hygiene.

Our quarantine station is situated on Ship Island, about 24 miles (E. S. E.) from our town, and it is under the supervision of the National Board of Health. We consider ourselves sufficiently protected on that side, under the present system of quarantine, against the importation of yellow fever. Never was a case traced back to our shipping in this county. It is not probable that it could now be introduced in the face of all the precautions that are being taken.

Before a vessel enters our port it must pass by Ship Island. There it is boarded by the quarantine officer, who detains all vessels coming from infected ports to be cleansed, fumigated, disinfected, and kept under observation until it is thought safe to give "free pratique."

Pass Christian enjoyed perfect immunity from yellow fever from 1867 until 1878, and that in spite of daily constant intercourse both by land and water with the city of New Orleans.

The site of Pass Christian was originally a sandy ridge facing the waters of the gulf, and with the exception of the drainage of one low lot, the building of a shell-road in front, and draining-ditches in the rear, its natural conformation never was changed. The land drains from front to rear, little or no water reaching the gulf, excepting the natural sipage water. There are no ravines traversing the city. It is perfectly level all through and well drained for an extent of 4½ miles. There have been no water courses to fill up or to modify in any way.

There are no manufactures, although we know of no spot in the south which offers greater advantages for the canning of oysters and other shell-fish, and for cotton, wool, and glass factories.

The lowest lot is about 6 feet lower than the average level, but it is thoroughly ditched and is drained into the Gulf.

The water supply is good, and almost exclusively furnished by wells having an average depth of from 10 to 15 feet. These wells are sufficiently remote from any contaminating influence. Typhoid fever and diphtheria are both unknown here.

The privies are 5 feet or more deep, sufficiently remote from the residence and water supply, a trap-door connecting with the rear enabling one to remove or disinfect their contents. For the latter purpose lime and copperas are freely used.

The slaughter-house is situated at a distance of three-quarters of a mile in the pine woods. It is kept in a tolerably fair condition. No sickness was ever caused by it.

Each residence has its own wharf, and bath-house attached, extending out into the Gulf to a distance varying between 300 and 400 feet, where at high tide an average depth of water is reached ranging between 3 and 4 feet only, for at this point the white, sandy bottom slopes so gradually that all danger to ladies and children is avoided. The greatest depth of water in the harbor varies between 12 and 15 feet.

At a short distance north of the town and at an elevation of 150 feet above the level of the Gulf is located the largest vineyard in the South, comprising 82 acres covered with vines, and where delicious champagne, still, and claret wines are made in large quantities.

Here is located the Mississippi Military Institute, where is received a full collegiate education. There are also several schools for boys, girls, and young ladies. Another large college is now being erected by the Christian Brothers, and will be open by next November. We have three churches, one Episcopal, one Roman Catholic, and one Presbyterian, all at or near the center of the town.

Those who are in pursuit of health cannot find a more delightful climate. Northerners can come down by the middle of November and remain even up to the 1st of June without experiencing either extreme of heat or cold.

Visitors can readily rent a house for the season or a whole year, or, if preferred, obtain board in some private family at a moderate price.

PHILADELPHIA, PA.—Dr. R. A. Cleemann, health officer, sends the following report for the last three months of 1880:

The temperature, the most important climatic element in regard to the death-rate, was unfavorable in Philadelphia during the last quarter of the year 1880 for a low mortality; for the mean reading of the thermometer during that period, calculated from the monthly means as recorded at the United States signal station in this city, was only 41.4° F., or nearly three degrees below the average for the quarter during nine years (1872–1880). I assume that it has been shown that wide departures from the average of temperature in climates, either in the direction of greater cold or more excessive heat, raise the death-rate.

Each of the months in the quarter was colder than usual, but December fell most below its average, the mean temperature for the month being but 28.6° F., or about five and a half degrees below that average. The highest point reached by the mercury during the month was 52° F., and the lowest 5° F., making a thermometric range of 57° F. During four consecutive days, in the first half of the month (8th, 9th, 10th, 11th), the thermometer marked continuously below the freezing point; and also for the last three days in December, in this period the mercury never rising above 14° F.

A drought during the first two months of the quarter led to a deficiency of rainfall in the three months taken collectively, only 7.54 inches being registered for the whole quarter instead of the average 9.40 inches. The precipitation in December, however, was considerably greater than usual, as much as 4.05 inches of water being measured instead of the average 2.68 inches. This was due to a snowstorm in the latter part of the month, more severe than has been observed for many years in Philadelphia, the fall of snow on the 26th measuring, when melted, 1.19 inches. The mean relative humidity of the atmosphere during the quarter did not differ much from the average, being expressed as 69.9 saturation = 100. December was, as usual, the most humid of the months, registering for its mean 74.3°, to 67.5° in October and 67.9 in November.

The whole number of deaths recorded during the quarter (thirteen weeks, October 3, 1880, to January 1, 1881) was 4,222, divided among the several months as follows: October (4 weeks), 1,150; November (4 weeks), 1,252; December (5 weeks), 1,820. The aggregate does not include the still-born, numbering 191, or the deaths following premature birth, which reached 64. The mortality is much greater than in the corresponding quarter of the previous year, when the record showed only 3,574 deaths in 14 weeks. With the population of Philadelphia at 846,980 inhabitants, as determined by the late United States census, it corresponds with an annual death-rate of 19.92 deaths to a thousand inhabitants living, nearly reaching the actual annual death-rate for 1880, which, calculated from the figures given in my letters to the Bulletin, was 20.54. This distribution of the deaths makes nearly 25 per cent. of the annual mortality fall to the last quarter, which is, as a rule, in Philadelphia the healthiest of the year, only about twenty-two per cent. having been the proportion during the sixteen years previous to 1877.

There were, as usual, more deaths among males than females, 2,197 of the former dying to 2,023 of the latter; and the mortality was divided among the several ages as follows: Under one year, 687; between one and two years, 202; between two and five years, 363; between five and ten years, 228; between ten and fifteen years, 89; between fifteen and twenty years, 141; between twenty and thirty years, 505; between thirty and forty years, 436; between forty and fifty years, 402; between fifty and sixty years, 356; between sixty and seventy years, 325; between seventy and eighty years, 283; between eighty and ninety years, 174; and beyond 90 years, 31. It appears that nearly thirty per cent. of the mortality fell upon children under five years of age; a large proportion, but considerably less than in the previous two quarters, when cholera infantum was slaying its hecatombs of little ones. According to the classification adopted in previous letters, the deaths were thus distributed:

I. ZYMOTIC DISEASES, 988; including *miasmatic diseases*, 950 (small-pox, 317; measles, 3; scarlatina, 98; diphtheria, 101; croup, 92; whooping cough, 22; typhoid fever, 159; typhus fever, 7; erysipelas, 12; puerperal fever, 4; dysentery, 11; diarrhœa, 24; cholera infantum, 8; cholera morbus, 3; malarial fevers, 17; rheumatism, 17; cerebro-spinal meningitis, 22; other miasmatic diseases, 33); *enthetic diseases*, 7; *dietic diseases*, 28; *parasitic diseases*, 3.

II. CONSTITUTIONAL DISEASES, 979; including *diathetic diseases*, 155 (cancer, 91; other diathetic diseases, 64); *tubercular diseases*, 824 (tabes mesenterica, 97; phthisis pulmonum, 689; other tubercular diseases, 38).

III. LOCAL DISEASES, 1,697; including *diseases of the nervous system*, 570 (cephalitis, 197; apoplexy, 94; paralysis, 101; convulsions, 124; other diseases of the nervous system, 54); *diseases of organs of circulation*, 253 (pericarditis, 36; aneurism, 8; heart diseases, 202; other diseases of organs of circulation, 7); *diseases of respiratory organs*, 484 (bronchitis, 116; pleurisy, 15; pneumonia, 313; other diseases of the respiratory organs, 40); *diseases of digestive organs*, 244 (enteritis, 86; peritonitis, 27; intestine diseases, 34; stomach diseases, 8; liver diseases, 68; other diseases of the digestive organs, 21); *diseases of urinary organs*, 116 (nephritis, 7; Bright's disease, 73; other diseases of urinary organs, 36); *diseases of generative organs*, 19 (diseases of ovaries, 5; uterus diseases, 14); *diseases of organs of locomotion*, 6 (caries and necrosis, 5; joint disease, 1); *diseases of the integumentary system*, 5.

IV. DEVELOPMENTAL DISEASES, 397; including *developmental diseases of children*, 32 (malformations, 31; teething, 1); *developmental diseases of adults*, 6 (puerperal convulsions, 6); *developmental diseases of old people*, 176 (old age, 176); *diseases of nutrition*, 183 (debility, 109; inanition, 74).

V. VIOLENT DEATHS, 157; including *accident or negligence*, 139 (drowning, 10; otherwise, 129); *homicide*, 3; *suicide*, 15.

CAUSES NOT SPECIFIED, 4. Total, 4,222.

Compared with the previous quarter, there was a diminution of 229 deaths. This was due to a considerable falling off in the mortality from zymotic, constitutional, and developmental diseases, and from violent deaths, for there was quite an increase in that from local diseases. The decrease is readily accounted for by the lowered temperature, which tended to exclude cholera infantum in the first class mentioned, to diminish immensely tabes mesenterica in the second, to make deaths from diseases of nutrition less likely to occur, and to cut down many fold the cases of drowning by removing the desire for bathing in rivers and ponds. On the other hand, the same cold which we have seen was excessive in December was responsible for the augmented mortality from local diseases, since among these maladies it is only those of the respiratory system which furnish more deaths, especially pneumonia and bronchitis. Though the deaths from zymotic diseases were less in the aggregate, as has been said, there were several of the most important diseases of this class which multiplied their victims very much, as compared with the previous quarter. The deaths from small-pox increased from 50 to 307; those from scarlatina, from 48 to 98; those from diphtheria, from 51 to 101; and those from croup, from 42 to 92.

Undoubtedly the most striking feature in the above comparison is the augmented mortality from small-pox. The steady march onward, which seemed broken in the summer, is not encouraging; the most to be said is, that it is not as bad as it might be. Compare, for instance, the course of the disease in the severe epidemic of 1871–72 in Philadelphia. The progressive monthly increase in the number of deaths from September to December, 1871, reads, 18, 236, 735, 861. This year in the same months the mortality was, 33, 43, 85, 189. In the earlier year the advance was frightfully rapid; in the later it goes in slower measures. The question suggests itself, What is the cause of this difference? Can it be accounted for by diverse degrees of intensity in the poison of the two epidemics? A negative answer is supplied by the experience of Camden, a small city situated directly opposite Philadelphia, on the Jersey side of the Delaware River. Variola was carried there from Philadelphia in February, 1880, and caused, as I am informed by Dr. James H. Wroth, of that city, in the space of one year, among a population of 41,638 inhabitants, 131 deaths. The same proportion of deaths to population in Philadelphia would bring up the mortality in the latter city during the first year after the appearance of the disease in November, 1879, to 2,264 deaths, instead of the actual mortality of 156. Assuredly, then, the poison of the present epidemic could show intense activity under certain conditions, and we may claim that the removal of those conditions explains the happier result in Philadelphia; that the prompt effort at isolation of the sick, the lessening of the number of the unprotected by wide vaccination and revaccination, and the elimination of unsanitary surroundings, had their legitimate effects.

But the more rapid increase in the mortality from small-pox in Philadelphia as we enter the second year of its invasion—85 deaths in November and 189 in December, more than in the whole of its first year—points out only too clearly that the means of repression employed have failed of a perfect success. They have not been used with sufficient thoroughness, especially isolation, revaccination, and vaccination.

Isolation is the most urgent measure to be resorted to when small-pox appears in a community, and this was undertaken in every case at first in Philadelphia; but the health authorities soon met with resistance, and deemed it wise, in the absence of a specific law of the commonwealth, or city ordinance, giving them absolute power to remove the sick, not to use physical force in executing this means, except in extreme instances. Most of the cases of small-pox occurred

among the lower class of people, those who live from hand to mouth, as the saying is, who are obliged to go to the provision shop to procure articles for every meal, and of which all the elder members go abroad to their daily work. What opportunities for dissemination of the poison! especially when the messenger to the shop was likely to be a convalescent member of the family, conveniently at home! And yet such people refused to let their sick go to the hospital. If isolation is not complete, then vaccination and revaccination must be complete. To accomplish the last will be found in practice to be almost impossible, certainly so without a most stringently enforced law. It would be necessary, in order to stamp out *infallibly* the disease, for every inhabitant of the city to be at once vaccinated, or revaccinated, as soon as a case of small-pox made its appearance, for the period of immunity gained by vaccination or revaccination is certainly an uncertain one, and it would not do to trust to an operation performed at some previous time. During the epidemic of 1871–72 I reported in the Philadelphia Medical Times (March 15, 1872) a case of varioloid following within three months of successful double vaccination. It is true the attack was exceedingly light, under circumstances of great exposure; but how dangerous even a mild attack of varioloid may prove is seen in an instance which has lately come under my observation. A father, so lightly stricken with the disease that he did not suspect its nature, thinking of no consequence a few vesicles which appeared upon his arms and hands, tended, in the absence of the mother, his child, an unvaccinated infant six weeks old. Variola followed, ending in the death of the child.

Small-pox gains little headway in the central, richest, busiest part of Philadelphia, but few cases being reported from there; the increase in mortality still belongs to the outlying districts formerly known as Kensington and Southwark, respectively, regions most severely visited by the disease in the epidemic of nine years ago.

In a previous letter (February 18, 1880) I mentioned the probability of an exacerbation in the mortality from scarlatina at the close of 1880; that probability has become a fact, the 98 deaths from the disease during this quarter being double the mortality caused by it in the previous three months.

Diphtheria and croup show in their increased mortality nothing more than the usual effect of the season; the 101 deaths from the former and 92 from the latter do not express a mortality sufficiently large to cause one to dread a parallel for Philadelphia to what has occurred in some neighboring cities.

The increase in the number of deaths from typhoid fever, which I noted in my last letter as having occurred in the third quarter of the year, was continued into the last three months, a few more deaths, indeed, falling to the latter period; the customary seasonal decline took place after the August maximum till a number not far from the average for the period of the year was reached in October, but from this month there was an increase in the mortality up to the December maximum, which was greater than that for any year since 1876. I discussed in the letter referred to the reasons for the advance in the August maximum, and now I will take this maximum as the basis to explain the larger number of deaths in December. Assuming that the poison of typhoid fever is produced in successive crops, a position sustained by many considerations, we can readily imagine that the more numerous germs called into existence in August brought forth a greater quantity of the poison than usual in December to sicken and destroy. Fortunately for the future, as regards the mortality from this disease, December was, as we have seen, unusually cold, and the whole winter also uncommonly severe, so that, relying on the acknowledged effect of a prolonged low temperature in antagonizing the poison of typhoid fever, we may expect a lessened effect from its action in the coming spring and summer.

Allusion has already been made to the large number of deaths from diseases of the respiratory organs. The whole number was 484, while in the previous quarter the deaths from the same cause had been but 224; the number exceeded also considerably that reported for the last quarter of 1879, an unusually mild season, when the deaths from diseases of these organs counted 405.

I have added a classified list containing the number of deaths from each cause in Philadelphia during each month of the year 1880, and during the whole year. The total number of deaths, 17,393, gives a death-rate for the year 1880, as already observed, of 20.54 deaths to a thousand persons living. For the year 1879 the death-rate of Philadelphia was 18.65, and for the year 1878 it was 19.38, while the average death-rate for the ten years 1870–79 was 21.38. Therefore, while 1880 was less healthy than either of the two years just before it, it was still healthier than the average during the preceding ten years. In calculating the above rates, the figures of the United States census for 1870 and for 1880 were taken, and it was assumed that the 172,950 inhabitants which Philadelphia gained during the decade had been added to the several years in equal increments of one-tenth of that sum. This, of course, is not exactly true, but the error is so small that it may be lost sight of in the computation.

Among the causes of death during the year 1880, the following are noted: Consumption 2,647, pneumonia 1,230, bronchitis 405, pleurisy 46, other lung diseases 187, croup 292, diarrhœal diseases 1,642, other diseases of digestive organs 663, Bright's disease 254, cerebro-spinal meningitis 57, apoplexy 299, sunstroke 37, heart diseases 837, diphtheria 316, enteric fever 182, malarial fevers 49, measles 106, scarlet fever 287, whooping-cough 101, puerperal diseases 51, small-pox 424, accidents and violence 660, and old age 688 deaths. Total deaths during the year 17,393; population 846,980; annual death-rate 20.5 per 1,000.

VICKSBURG, MISS.—Dr. W. T. Balfour, health officer, under date of March 2, makes the following report to the State board of health of Mississippi, concerning a case of small-pox which had been taken to the pest-house of Vicksburg:

The patient, P. Flynn, age 28 years, a native of Louisville, Ky., left that city February 21, as deck-hand on the tow-boat *J. S. McDonald*. He states that he was well at the time, and knew of no exposure to small-pox in his boarding-house or elsewhere before leaving Louisville. He was taken sick March 8; the boat reached New Orleans on the 10th, and he remained on board under the care of the captain and steward. Pains in the back and limbs were the first symptoms; no fever was observed till March 12, and on the next day an eruption appeared on the face, spreading in a few hours to the neck and hands. Subsidence of fever followed, and when put off at Vicksburg, March 15, he was first taken to the city hospital. Here the disease was immediately recognized and the patient transferred to the pest-house. The case is one of confluent small-pox and will probably prove fatal. Vaccine virus has been ordered, and all precautions against infection will be taken.

VINELAND, N. J.—Dr. Charles Brewer, under date of April 1, observes that only one case of scarlet fever has occurred in the town during March, and that measles, though still prevailing, are very mild in type. The sanitary authorities are doing all in their power to promote the health of the town.

SANTA CRUZ, PALMA, CANARIES.—United States Consul F. W. Lavers reports 17 deaths in January and 19 in February, none of which were from contagious diseases. Annual death-rate for January, 30.2 per 1,000; for February, 37.4 per 1,000.

SINGAPORE.—United States Consul A. G. Studer reports this district free from infectious and contagious diseases up to February 21. The official report for the month of January gives a total of 325 deaths, of which consumption caused 29; bronchitis, 8; diarrhœa, 35; dysentery, 4; fever, 91; syphilis, 31; small-pox, 3; leprosy, 11.

QUARANTINE NOTICE.

The following notice is published for the information of all concerned:

NEW YORK, *March* —, 1881.

All vessels leaving Mexican and West Indian ports, and ports on the east coast of South America, on and after the 1st of April proximo, not having bills of health, will be treated at this quarantine as vessels suspected of being infected.

WM. M. SMITH, *Health Officer.*

DENMARK.—The Department of State, under date of March 30, informs the National Board of Health that from the 7th day of March the quarantine notice of the Danish Government as to the ports of Caracas, La Guayra, and Porto Cabello is extended to the ports of St. Thomas, West Indies, and Rio de Janeiro, on account of the prevalence of yellow fever in those ports. The notice referred to was published in No. 39 of the BULLETIN, page 745.

ASPINWALL.—Advices from Aspinwall, under date of April 6, report the existence of small-pox at that port and of yellow fever at Panama.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING MARCH 26, 1881.

ABSTRACTS FROM CONSULAR REPORTS.

ACAPULCO, MEXICO.—United States Consul John A. Sutter reports for three weeks ending March 6, that 20 cases and 14 deaths from small-pox have occurred. The deaths from all causes were 28, giving an annual death-rate of 139 per 1,000. Mean temperature 84°.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports for the month of February, 77 deaths in Georgetown, but none from contagious diseases. The population being 20,000, the annual death-rate was 50.2 per 1,000. Mean temperature, 81°.

The consul also reports that the regulation requiring vessels bound for ports in the United States to take bills of health from the consul, when by him advised to do so, has not been observed by the following vessels sailing from Georgetown within the two weeks ending March 9: Brig *O. C. Clary* for New York via St. Kitts; brig *Mary Munro* for New York; schooner *North America* for Boston; and schooner *Fanny Young* for Portland, Me.

BORDEAUX, FRANCE.—United Consul B. Gerrish reports 131 deaths during the month of February. Small-pox caused 11 deaths; typhoid fever, 3; other contagious diseases, 15; consumption, 66; other lung diseases, 15. The population being 215,140, the annual death-rate was 21.5 per 1,000.

CONSTANTINOPLE.—United States Consul G. H. Heap forwards additional telegrams, to March 11, from Dr. Zitterer, with regard to the plague in Persia. The most stringent measures of quarantine have been enforced, and the inspectors advise the evacuation of Djaara and the immediate burning of all infected huts and articles of personal use. The government is called on to furnish food, clothing, and shelter for those deprived of homes and means of living. Dr. Zitterer gives the following symptoms as observed in most of the cases of plague: extreme debility, anorexia, high fever, thirst, foul tongue, headache, glassy eyes, anxious expression; diarrhœa is common, vomiting of blood sometimes, or hæmaturia. Glandular swellings in most cases under the arms or in the groins (hence the name *peste bubonique*); the final symptoms are extreme prostration, coma, and death often occurs in less than 48 hours from the inception of the disease.

GHENT, BELGIUM.—United States Consul A. Lefebvre sends a report for the month of February, showing 1 death from small-pox, 9 from typhoid fever, 2 from scarlet fever, and 3 from diphtheria. Consumption caused 52 deaths, other lung diseases 54, diarrhœal diseases 32, and diseases of the heart 34. The deaths from all causes were 310; population 134,852; annual death-rate 30 per 1,000.

GUAYMAS, MEXICO.—United States Consul A. Willard reports for the month of February 18 deaths, of which 7 were from "fever." No epidemic or contagious disease is reported.

MATAMOROS, MEXICO.—United States Consul W. P. Sutton observes, in his report for the week ending March 19, that small-pox has assumed a milder type since the cold weather has passed; but the number of cases has probably increased. Five deaths from small-pox were reported for the week, out of a total of 12. Annual death-rate, 39.0 per 1,000.

MAZATLAN, MEXICO.—For the month of February, United States Consul E. G. Kelton reports 9 deaths from fever, 8 from diarrhœa, and 11 from consumption. Total deaths 43; population 14,000; annual death-rate 40 per 1,000. Mean temperature 71°.

MOSCOW, RUSSIA.—United States Consul A. Weber reports a total mortality of 1,820, in this city of 601,970 inhabitants, for the month of December, 1880. Annual death-rate, 33.9 per 1,000. Among the causes of death were: Small-pox, 33; typhoid fever, 179; other contagious diseases, 131; consumption, 280; other lung diseases, 189; diarrhœal diseases, 168. The mean temperature for the month was 21°.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports, for the two weeks ending March 26, that the island is free from all infectious diseases, and the town in excellent sanitary condition. Mean temperature, 72°.

SANTANDER, SPAIN.—The report from this province for the four weeks ending December 26 gives a total of 439 deaths, of which 97 were under one year, 164 under five years, and 128 over sixty years of age. Small-pox caused 4 deaths; measles, 2; diphtheria and croup, 16; whooping-cough, 5; enteric fever, 3; typhus fever, 5; dysentery, 29; diarrhœa, 34; malarial fevers, 3; consumption, 30; other lung

diseases, 24. Births, 153. Population, 235,300. Annual birth-rate, 26.0; annual death-rate, 24.8 per 1,000.

SHANGHAI, CHINA.—United States Consul O. N. Denny, under date of February 16, gives the following reasons for the absence of the desired statistics in his reports: Dr. Neil Macleod, who has furnished the information so far given, states that there are no municipal regulations requiring any report of cases of contagious disease. There are ten physicians practicing in the city, and none of these will make the reports unless required by law, or paid for their trouble. The population is very mixed—nearly all the nations of the world being represented—and in the absence of reports from medical men information could only be obtained through the various foreign consuls. The reports given by Dr. Macleod are correct as to deaths, but only approximate as to cases.

The inclosed report of Dr. Edward Henderson, health officer, for the year 1880, states that 78 deaths of foreigners were registered during the year. Among these the following causes are noted: small pox 3, measles 1, enteric fever 2, cholera 2, heart diseases 4, consumption 12, other lung diseases 3, diarrhœal diseases 5, suicide 2, violence and accidents 9. In view of the large surrounding native population over whom foreign medical officers have but little influence in sanitary matters, it is remarkable that the contagious diseases usually prevailing more or less among the natives have not been epidemic among the foreign residents.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge forwards the official report for February. There were 127 deaths during the month, giving an annual rate of 82.8 per 1,000. Among the causes of death noted are: diarrhœa 4, dysentery 2, malarial fevers 3, pneumonia 1. It is remarkable that consumption does not appear on the list.

The reports for the two weeks ending March 20, show 17 deaths from yellow fever and 7 from small-pox during that time.

ZURICH, SWITZERLAND.—The report for the fourth quarter of 1880 gives 126 births in a population of 25,000; annual rate 20.2 per 1,000. The deaths during the same period were 101; annual rate 16.1 per 1,000. Still-births 11. Among the causes of death were: diphtheria and croup 3, scarlet fever 1, typhoid fever 1, consumption 17, other lung diseases 14, apoplexy 6, diarrhœa 3, suicide 5.

The following reports for the week ending March 26, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 78,000; deaths, 31; under 5 years, 17; cerebro-spinal meningitis 3, consumption 4, typhoid fever 1, scarlet fever 4, pneumonia 2, measles 1. Bath, Me., 8,000; deaths, 5; consumption 1, congestion of lungs 2. Belfast, Me., 5,308; death, 1. Brattleboro, Vt., 6,000; death, 1. Bucyrus, Ohio, 3,950; deaths, 2; under 5 years, 1; pneumonia 1. Calais, Me., 6,162; death, 1; consumption 1. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 5,930; no deaths. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 3; under 5 years, 1. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 955; deaths, 2; consumption 1. Dallas, Tex., 10,327; deaths, 5; under 5 years, 1; cerebro-spinal meningitis 1, croup 1, typhoid fever 1, pneumonia 1. Decatur, Miss., 1,000; death, 1. Fayette, Miss., 400; no deaths. Gunn City, Mo., 125; no deaths. Hernando, Miss., death, 1; puerperal 1. Huntingdon, Pa., 4,500; death, 1. Iuka, Miss., 816; no deaths. Indianola, Tex., 800; no deaths. Jefferson, Tex., 3,250; deaths, 3; under 5 years, 2; consumption 1, pneumonia 1, puerperal 1. Kenosha, Wis., 5,500; no deaths. Louisiana, Mo., 5,000; deaths, 3; under 5 years, 1; diarrhœa 1, measles 1. Madison, Ind., 9,009; deaths, 3; under 5 years, 2. Meridian, Miss., 4,013; no deaths. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; death, 1; congestion of lungs 1. Muscatine, Iowa, 8,112; death, 1; under 5 years, 1; scarlet fever 1. Muskegon, Mich., 11,300; death, 1; typhoid fever 1. Niles, Mich., 4,200; death, 1; pneumonia 1. Painesville, Ohio, 5,504; deaths, 2; consumption 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; death, 1. Rensselaer, Ind., 900; death, 1; under 5 years, 1; accident 1. Senatobia, Miss., 935; death, 1; consumption 1. Springfield, Ohio, 21,000; deaths, 13; under 5 years, 6; accident 1; consumption 4, whooping-cough 1. Starkville, Miss., 1,454; death, 1; consumption 1. Summit, Miss., 1,760; deaths, 3; consumption 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; death, 1. Tuscaloosa, Ala., 2,000; no deaths. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; deaths, 2; under 5 years, 1; scarlet fever 2. Winona, Minn., 10,000; deaths, 2; accidents 2. Youngstown, Ohio, 15,421; deaths, 3; under 5 years, 1; malarial fever 1; pneumonia 1. Total population, 283,050; deaths under 5 years, 35; total number of deaths, 95; annual rate per 1,000, 17.5.

TULLIO S. VERDI, M. D., &c. 815 Fourteenth street, N. W., Washington, D. C.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, APRIL 16, 1881. [No. 42.

A STATE BOARD OF HEALTH FOR INDIANA.

The following bill has been passed by the legislature of Indiana:

A BILL ESTABLISHING A STATE BOARD OF HEALTH, DEFINING ITS PURPOSES, POWERS, AND DUTIES; PROVIDING A SYSTEM OF REGISTRATION AND REPORT OF VITAL AND SANITARY STATISTICS IN CONNECTION THEREWITH, AND PRESCRIBING THE DUTIES OF CERTAIN STATE, COUNTY, TOWNSHIP TOWN, AND CITY OFFICERS IN RELATION THERETO.

SECTION 1. *Be it enacted by the general assembly of the State of Indiana*, That a board is hereby created and established which shall be known under the name of the State board of health. It shall consist of 5 members, as follows: 4 members who shall be appointed by the governor, with the consent of the senate, and a secretary as prescribed in section four of this act. The 4 members so appointed shall be so designated by the governor that the term of office of 2 shall expire on the last day of February, 1883, and 2 on the last day of February, 1885. Thereafter the governor, with the consent of the senate, shall biennially appoint 2 members who shall hold their offices for four years. Any vacancy in said board may be filled by the governor until the next regular meeting of the general assembly.

SEC. 2. The State board of health shall have the general supervision of the interests of the health and life of the citizens of this State. They shall especially study the vital statistics of this State, and endeavor to make intelligent and profitable use of the collected records of deaths and of sickness among the people. They shall make sanitary investigations and inquiries respecting the causes of disease, and especially of epidemics, the causes of mortality, and the effects of localities, employments, conditions, ingesta, habits, and circumstances on the health of the people. They shall, when required, or when they deem it best, advise officers of the government, or other State boards, in regard to the location, drainage, water supply, disposal of excreta, heating and ventilation of any public institution or building. They shall, from time to time, recommend standard works on the subject of hygiene for the use of schools of the State; and it shall be the duty of the board to examine into the purity and chemical qualities of the intoxicating liquors used as a beverage in this State, and report what, in their best judgment, is the effect of the use of such intoxicating liquors as a beverage upon the industry, prosperity, happiness, health, and lives of the citizens of the State. They shall, prior to the 15th day of November of each year, make a report to the governor of their doings, investigations, and discoveries during the year ending on the 31st day of October next preceding, with such suggestions in regard to legislative action as they may deem important.

SEC. 3. The board shall meet at least once each quarter, in the city of Indianapolis, and as often as they may deem necessary, and at such other places and times as they may deem expedient. A majority shall be a quorum for the transaction of business. They shall choose one of their number to be their president, who shall serve two years, unless his term of office as a member of the board shall sooner expire. They may adopt rules and by-laws, subject to the provisions of this act. They shall have authority to send their secretary or a committee of the board to any part of the State when deemed necessary to investigate the cause of any special or unusual disease or mortality.

SEC. 4. At their first meeting, or as soon as a competent and suitable person can be secured, the board shall elect a secretary, who shall, by virtue of such election, become a member of the board, and its executive officer, and who shall serve four years, unless sooner removed for just cause by the votes of 3 members of the board voting therefor. The board shall deliver to such secretary a written statement of the cause of removal, and also state the cause of such removal at the next session of the general assembly.

The board may elect one of their own number secretary, in which case the governor shall appoint another member to complete the full number of the board.

SEC. 5. The secretary of the board of health shall be a physician, and the health officer of the State. He shall keep his office at Indianapolis, and shall perform such duties as are prescribed by this act, or may be required by the board.

He shall keep a record of the transactions of the board; shall have the custody of all books, papers, documents and other property belonging to the board which may be deposited in his office; shall, so far as practicable, communicate with other State boards of health, and with the local boards of health within this State; shall keep and file all reports received from such boards, and all correspondence of the office appertaining to the business of the board. He shall, so far as possible, aid in obtaining contributions to the library and museum of the board. He shall prepare blank forms of returns, and such instructions as may be necessary, and forward them to the clerks of the several boards of health throughout the State. He shall collect information concerning vital statistics, knowledge respecting diseases, and all useful information on the subject of hygiene, and through an annual report and otherwise, as the board may direct, shall disseminate such information among the people.

SEC. 6. The secretary shall receive an annual salary not to exceed $1,200, which shall be fixed by the State board of health. The board shall quarterly certify the amount due him, and on presentation of said certificate the auditor of state shall draw his warrant on the State treasurer for the amount. The members of the board shall receive no per diem compensation for their services, but their traveling and other necessary expenses while employed on the business of the board shall be allowed and paid upon an itemized account, verified by the oath of the member for whom such claim is made.

SEC. 7. The State board of health shall have supervision of the system of registration of births, deaths, and marriages, as herein provided, and they shall make up such forms and shall from time to time recommend such legislation as they may deem necessary for the thorough registration and report of vital and sanitary statistics throughout the State. The secretary of the board shall be superintendent of all such registration, and the clerical duties and safe-keeping of the bureau of vital and sanitary statistics thus created shall be provided for by the secretary of state upon requisition of the secretary of the State board of health, approved by the president thereof.

SEC. 8. The trustee and assessor of each township, the trustees of each town, the mayor and common council of each incorporated city, except where a regular constituted board of health, by ordinance of such city, now exists or may hereafter be created, and the board of county commissioners of each county, shall constitute a board of health, *ex officio*, for each of the several towns, cities, and counties of the State, who shall perform such duties as are respectively required of them by this act, without compensation. They shall annually, in the month of January of each year, complete their organization by the election of a secretary, who shall be a physician. The secretary of such local boards of health and the secretary of any regular constituted board of health of any incorporated city shall be the health officer of every town, city or county for the purposes provided in this act, and shall be allowed such compensation from the town, city or county as the board electing them may determine: *Provided*, That the secretary of each county board of health shall render such medical and surgical services as may be required by persons confined in the county jail of such county, and such other medical services as may be required by the board of county commissioners.

The board of health of each county shall act in conjunction with the State board of health, and it shall be the duty of the secretary of such county boards, at least once in each year, and as often as may be deemed necessary by the State board of health, to report such facts and statistics as may be required under instructions from, and according to forms and blanks furnished by, said board; and the board of health of each town and city, situate in any county of this State, shall act in conjunction with the board of health of such county; and it shall be the duty of the secretary of such local boards, at least once each quarter, and as often as may be deemed necessary by the county board, to report such facts and statistics as may be required under instructions from and according to forms and blanks furnished by the State board of health through such county boards. And every physician in each town, city, and county shall be required to report to the secretary of the board of health of such town, city or county, such facts and statistics as may be required by him under the direction of the county board, or of the State board through such county board; and such town, city, and county boards shall have authority, and it shall be their duty in the locality concerned, under the direction of the State board of health, to promulgate and enforce such regulations for the preservation of public health and the prevention of epidemic and contagious diseases, as may be deemed advisable by them; and any per-

son or persons or the officers of any corporation neglecting or refusing after having been notified in writing to comply with the requirements of such regulations, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined in any sum not less than $5 nor more than $25, and each day said failure or refusal shall continue shall, after proper notification, constitute a separate offense.

SEC. 10. It shall be the duty of all physicians and accoucheurs in this State to register their names and post-office address with the clerk of the circuit court of the county in which they reside, and all such physicians and accoucheurs shall report to the secretary of the board of health of the town, township, or city in which they may occur, and within fifteen days thereafter, all births and deaths which may occur under their supervision, with a certificate of the cause of death and such co-relative facts as may be required in the blank forms furnished as provided in this act. When any birth or death shall occur with no physician or accoucheur in attendance, then such birth or death shall be reported as hereinbefore provided by the householder where or under whose observation such birth or death may occur, with the cause of death if such be known. Any physician, accoucheur, or householder willfully or purposely, after notice by the secretary of the local board under whose jurisdiction such householder may live, failing or refusing to comply with the provisions of this section, shall be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be fined in any sum not less than five dollars nor more than ten dollars: *Provided*, That any death coming under the jurisdiction or supervision of any coroner shall be by him reported to the secretary of the board of health of the town, city, or county in which such death may occur, within fifteen days after such death comes under his jurisdiction, and such death so reported shall not be required to be reported by any other person.

SEC. 11. The clerk of the circuit court of each county in this State shall be required to keep a book especially prepared and set apart for the registration of name and post-office address of physicians and accoucheurs of their county. And it shall be the duty of such clerk to report to the health officer of the county, on or before the 5th day of each month, the number of certificates of marriages that have been recorded during the preceding month, together with the names of parties contracting such marriage and the date when such marriage was solemnized: *Provided*, That the clerk shall be entitled to charge each physician and accoucheur so registered a fee of ten cents and no more, and the county commissioners shall allow such clerk 50 cents, and no more, for each monthly return made to the health officer of said county.

SEC. 12. It shall be the duty of the board of health of each county to keep a complete record, according to the form prescribed by the State board, of all marriages, births, and deaths reported to them under the provisions of this act, and such record shall be open to the inspection of any citizen without fee.

SEC. 13. It shall be the duty of the State board of health to prescribe the form for the records of marriages, births, and deaths to be used in the office of the secretary of the county board, and prescribe such forms, and the secretary of the State board shall, upon requisition of the health officer of each county, furnish him, and through him the secretary of each local board in such county, such blanks as may be required for the gathering and reporting of vital and sanitary statistics, according to the provisions of this act.

SEC. 14. And it shall be the duty of the secretary of state to provide a suitable office for the meetings of the State board of health, and for the secretary thereof.

SEC. 15. The sum of $5,000 per annum, or so much thereof as may be necessary, is hereby appropriated to pay the salary of the secretary and other necessary expenses of the State board of health, according to the provisions of this act. And the expenses of the State board of health shall in no event exceed the amount herein appropriated.

SANITARY LEGISLATION IN TENNESSEE.

Dr. J. D. Plunket, member of the State board of health, sends his report on vital statistics, from which the following remarks and copy of recent act of legislature are taken:

All of the older civilized countries and many of the States of the Union have made provision upon their statute-books for the registration and tabulation of vital statistics. Tennessee, however, is still among the few which have no law upon the subject, unless we make exception of a law relating to marriage licenses enacted by the legislature of North Carolina in 1778, and which is still operative in Tennessee, viz:

"Before being joined in marriage the parties shall produce to the minister or officer aforesaid—'all justices of the peace, judges and chancellors, in the State may solemnize the right of matrimony'—a license under the hand of the clerk of the county court where the female resides, or where the marriage is solemnized, directed to such minister or officer, authorizing the solemnization of a marriage between said parties." [Act 1778, ch. 7, secs. 2 and 3.]

This was amended by the legislature of Tennessee in 1815 and 1838 as follows:

"The minister of the gospel, or justice of the peace, or judge or chancellor, who solemnizes the right of matrimony, shall endorse on or append to the license the time of marriage, and sign his name thereto, and return the license to the clerk of the county court within six months thereafter.

"The clerk shall, at the foot or back of each license, place the following form of certificate, to be signed by the person solemnizing the marriage:

"I solemnized the rite of matrimony between the above (or within) named parties on the —— day of ——, 18—.

"It shall be the duty of the clerk to register, in a well-bound book, the names of the parties and the date of the issuance of a marriage license, and to copy immediately under or opposite thereto, the return of the proper functionary who solemnized the rites of matrimony, and the date thereof, and file and retain the license and return thereof in his office." [Acts 1815, ch. 47; 1838, ch. 118.]

It was also again amended in 1865–6, as follows:

"It shall be the duty of the officer or minister who has solemnized such marriages to return the certificate of the marriages to the office of the county court clerk of the proper county, and for a failure thereof he shall be liable to indictment or presentment for a misdemeanor, and this act to take effect from its passage." [Act 1865–6, ch. 58, sec. 2.]

REGISTRATION LAW.

An act to provide for the registration of births, marriages, and deaths in Tennessee.

SECTION 1. *Be it enacted by the general assembly of the State of Tennessee*, That every justice of the peace, minister of the gospel, and all other legally-authorized persons solemnizing marriage in this State, shall make a record of each marriage so solemnized by him, together with all the facts relating to the same, as required by the fifth section of this act; and such justice, minister of the gospel, or other person shall, at the time such marriage is solemnized, deliver on demand to either of the parties so joined in marriage as aforesaid a certificate of such marriage containing all the facts thereto, required by said fifth section of this act, and shall, within thirty days thereafter, deliver to the clerk of the county court in which such marriage took place a certified copy of such record.

SEC. 2. That every physician, surgeon, and midwife, who may be in professional attendance at any birth or death in this State, or in the absence of any or all of the aforesaid parties the head of or senior member of said household wherein said birth or death occurred, shall, within thirty (30) days thereafter, file a written statement, duly certified to, of the fact, together with such other facts pertaining thereto, as are required in section five (5) of this act, with the senior (by age) justice of the peace of the civil district in which said birth or death occurred.

SEC. 3. It shall be the duty of the aforesaid justice of the peace in each civil district in the State, on receiving the returns of such births or deaths, to record the same in a book to be furnished by the county, properly ruled in the order in which they are received by said justice, and once within each and every thirty days make and deliver to the county court clerk of the county in which such civil district is located a certified copy of such record.

SEC. 4. It shall be the duty of every coroner in this State to keep, in a well-bound book, a record of every inquest held in his district, and within thirty days after the holding of such inquest he shall deliver to the county court clerk of the county when in said coroner has jurisdiction a certified copy of such record, giving all the facts as required in section five (5) of this act for other deaths.

SEC. 5. It shall be the duty of the county court clerk of the several counties in this State, on receiving the returns of such births, marriages, and deaths, to record the same at length in separate books (well bound) to be provided by the county for that purpose, with proper indexes thereto. The births, marriages, and deaths shall be numbered and recorded in the order in which they are received by the said clerk, and the record of marriages shall be indexed, using both the name of bridegroom and bride. The record of births shall state, in separate columns, the date of the birth, the name of the child (if it have any), the sex and color of the child, the place of birth, the christian and surname of both parents, the residence and nativity of the parents, the occupation of the father, and the date when the record was made: *Provided*, That in case the child has no christian name, such name shall be obtained and reported by the head of the household wherein said birth occurred, within thirty days after his or her attention has been called to the fact by the senior (by age) justice of the peace, who shall do so *at once* upon discovering the omission, and such christian name shall be distinctly designated in such report as the christian name belonging to a child previously reported, and shall be properly entered by said justice in the blank left for such christian name in his book of record.

The record of marriages shall state, in separate columns, the date and place of marriage, the christian and surname of the bridegroom and bride, and the maiden name of the bride, if a widow, the color, age, and place of birth of each, the residence of each at the time of marriage, the occupation of the bridegroom and the name and official station of the person by or before whom they were married, the name and residence of at least two witnesses present at such marriage, and the date when such record was made.

The record of deaths shall state, in separate columns, the date of

the death, the christian and surname of the deceased, the sex and color, whether married or single, the age in years, months, and days, the place of death, the disease or apparent cause of death, the nativity of the deceased and the occupation, if any, and the names and residence of the parents, if known, and the date when such record was made.

The clerk of the county court of the several counties shall annually, on or before the 1st day of April, make and transmit to the secretary of state a certified copy of the records in his office of all the births, marriages, and deaths reported in their respective counties for the year ending December 31, last preceding.

And each county court clerk shall receive for the record of each birth, marriage, and death in his office three cents; and three cents for each birth, marriage, and death returned by him to the secretary of state, to be paid by the county upon the presentation of a certificate from the secretary of state that the duties herein imposed upon said county court clerks have been performed, and shall be compensation for all services required by this act to be performed by him.

SEC. 6. It shall be the duty of the secretary of state to receive the returns made in pursuance of the fifth section of this act, and he shall cause the same for each year to be bound together in one or more volumes at the expense of the State, and make indexes thereto, and with the assistance of the secretary of the State board of health, who is hereby constituted *ex-officio* "the superintendent of vital statistics," shall prepare such tabular statements, results, and deductions therefrom as will render them of practical utility, and make report thereof annually to the governor of the State, which report may be ordered published and distributed in such manner as the legislature may from time to time direct.

SEC. 7. Nothing contained in this act shall be so construed as interfering with the manner adopted at the time of the passage of this act by any municipality in this State for collecting such viral statistics, and it is hereby made the duty of every such municipality to cause to be made once in every thirty days a transcript of such municipal record, which, after being duly certified to, they shall cause the same to be delivered to the clerk of the county court in which county said municipality is located.

SEC. 8. In case of the refusal or neglect, by any of the officers or individuals mentioned in this act, to perform any of the duties hereinbefore required of them, or either of them, to be done and performed by any of the provisions herein contained, such officer or person shall be guilty of a misdemeanor, and upon conviction shall be fined not less than five nor more than fifty dollars, and the prosecuting attorney in each county or judicial district of the State is hereby required to prosecute, in the name of the people of the State of Tennessee, all persons in his county or judicial district who shall violate any of the provisions of this act.

SEC. 9. *Be it further enacted*, That all laws or parts of laws coming in conflict with this act be, and are hereby, repealed, and that this act take effect from and after its passage, the public welfare requiring it.

REGULATIONS FOR CONSULAR FEES.

APRIL 9, 1881.

The following regulations of the Treasury Department are published for the guidance of consular officers in the collection of fees provided for by the act of Congress "to prevent the introduction of contagious and infectious diseases into the United States," approved June 2, 1879.

By reference to the regulation dated September 1, 1879, it will be seen that the fee for the bill of health provided for by the statute is fixed at $2.50, and the actual expenses incurred in placing a vessel in proper sanitary condition are to be paid by the owners or master. The fee of 25 cents for the examination of each person by the medical officer is modified by the regulation of the Treasury Department, dated November 29, 1880, published herewith, and is fixed at $5 for fifty persons and under, &c., as therein stated.

From the fund thus created consular officers will pay all expenses incurred, including charges for boat hire and medical examinations.

T. J. TURNER,
Secretary National Board of Health.

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
September 1, 1879.

The department is in receipt of your letter of the 14th ultimo, in which, by direction of the executive committee of your Board, you inclose a copy of a communication from Mr. A. B. Wood, chief of the consular bureau of the State Department, accompanied by a printed copy of rules and regulations, made by your Board and approved by the President, to be used and complied with by vessels in foreign ports, under the authority of the act approved June 2, 1879.

The object of submitting these rules and regulations appears to be to secure action on the part of this department in fixing fees for certain services therein required. An examination of the act in question shows that the only fee which the statute requires in terms to be fixed by this department is that under section 6, in connection with the necessary expenses in placing vessels in proper sanitary condition. Under this section the regulations provide that the consular officers in foreign ports shall, upon the request of the owner, agent, or master, cause an inspection of every ship or vessel bound to any port of the United States, and upon such inspection issue the bill of health required by these regulations. In regard to this fee, it may be stated that section 1745 of the Revised Statutes directs that the President shall prescribe from time to time the rates or tariffs of fees to be charged for the official service of consular officers abroad.

Under the authority of this section the President has fixed, and the State Department promulgated in its regulations of 1874, p. 78, a consular fee for a bill of health at $2.50. This fee is to be exacted by the consul and by him paid into the Treasury as part of the receipts of his office; and it would not seem that a second fee is necessary for the bill of health required to be given by the regulations issued by the Board, except that in cases arising under paragraph 12 of the said regulations, where the departure of the vessel is delayed beyond the twenty-four hours therein specified, an addition to such fee of 50 per cent. may properly be made. The regular fee for the bill of health is, therefore, fixed at $2.50. The actual expenses incurred in placing the vessel in proper sanitary condition will, of course, vary with the circumstances of each case, and are to be paid by the ship-owners or masters; and it would not seem that any scale of prices for such services can be established. For the inspection and report under paragraph 11 of said regulations, a fee of 25 cents is hereby fixed for each person examined by the medical officer or physician selected for the purpose.

These are all the fees which it seems to this department are required to be fixed by the authority of these regulations.

Very respectfully,

H. F. FRENCH,
Assistant Secretary.

J. L. CABELL, M. D.,
President National Board of Health, Washington, D. C.

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., November 29, 1880.

SIR: Your letter of the 23d instant is received, in relation to a proposed schedule of fees to be substituted for the fee of 25 cents for each person, established by department letter to you of September 1, 1879, for the medical examination of persons on vessels in foreign ports about to sail for ports in the United States.

You state that you are directed by the executive committee of the National Board of Health to say that, in its opinion, the proposed schedule is just and equitable, and will doubtless secure in each case an amount adequate to the expense incurred.

The department, therefore, directs that the letter of September 1, 1879, be so far modified as to prescribe fees for the personal examination authorized by the "act to prevent the introduction of contagious or infectious diseases into the United States," approved June 2, 1879, as follows:

Fees for medical examination of persons on vessels bound from foreign ports to ports of the United States—

For fifty persons and under	$5 00
From fifty to one hundred persons, for each ten additional persons or less	1 00

Over one hundred, at the rate of $5 for each additional hundred persons.

In the cases which have arisen at the port of Kanagawa, Japan, the fees will be adjusted and settled on the basis of the above schedule.

Very respectfully,

JOHN SHERMAN,
Secretary.

DR. J. L. CABELL,
President National Board of Health, Washington, D. C.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING APRIL 2, 1881.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

INTERNATIONAL MEDICAL AND SANITARY EXHIBITION.

Notice is given by Mark H. Judge, secretary of Parke's Museum of Hygiene, University College, Gower street, London, that this exhibition will be open at South Kensington from July 16 to August 13, 1881, on the occasion of the meeting of the International Medical Congress.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

ABSTRACTS FROM CONSULAR REPORTS.

CONSTANTINOPLE.—United States Consul G. H. Heap, under date of March 22, forwards telegrams from the infected district on the Euphrates. It appears that the government has exercised most commendable promptness in aiding the sanitary authorities, and that very active measures have been enforced to prevent the spread of the plague.

MALAGA, SPAIN.—United States Consul H. C. Marston, sends through the Department of State a copy of the following quarantine order from the Spanish Government:

MADRID, *March* 12, 1881.

According to a telegram received from our consul, the plague has broken out in Djaara, in the district of Reljed, on the river Euphrates. If it should reach the ports of the Sea of Azof, the Black Sea, and those of Arabia, you will apply to this department for instructions as to the regimen to which vessels are to be subjected. I transmit the foregoing to you for your guidance. Let the order be obeyed.

The DIRECTOR *of the Health Department at Madrid.*

To the SUPERINTENDENT *of the Health Department at Malaga.*

MALTA AND GOZO.—United States Consul C. B. Eynaud reports for the two weeks ending February 28 one death from typhoid fever, but none from any other contagious disease. Total deaths, 151; population, 154,830; annual death-rate, 25.4 per 1,000.

SANTOS, BRAZIL.—United States Consul W. T. Wright forwards a report on the climate and health of this city. Since May, 1880, there has been no contagious or infectious disease in the city or shipping. Much improvement has been made in the drainage and general sanitary condition of the city. The rapid growth of all kinds of weeds offers a constant obstacle to the efforts towards strict cleanliness in any city under such a climate.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BUENOS AYRES.—Under date of January 10, Señor Pedro A. Pardo informs the National Board of Health that the Government of the Argentine Republic has recently created a department of hygiene, which will exchange reports with the United States when its work is fully established.

HAVANA, CUBA.—During the week ending April 1, there were 3 deaths from yellow fever and 28 from small-pox. Typhoid fever has increased in one portion of the city so far as to constitute an important element in the prevailing diseases, but so far the mortality has been comparatively small.

In the month of March, there were only 3 deaths from yellow fever, while small-pox caused 110 deaths.

LOWVILLE, N. Y.—Under date of April 6, Dr. F. B. Hough states that in the town of Greig, Lewis County, 32 deaths have occurred during the winter from diphtheria and croup with typhoid symptoms, indicating some local cause. No pollution of the water supply is known to exist, and physicians are inclined to ascribe the prevalence of diseases of typhoid type to the use of potatoes affected by the frost. These potatoes, unripe and altered by the action of cold, form a large part of the diet of the people in the town mentioned. It is thought that the use of such food may have produced the condition of system predisposing those affected to disease of typhoid character.

The following reports for the week ending April 2, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 78,000; deaths, 28; under 5 years, 15; accidents 2, cerebro-spinal meningitis 1, consumption 3, diarrhœa 1, diphtheria 1, scarlet fever 5, pneumonia 1, bronchitis 1, small-pox 1. Bath, Me., 8,000; deaths, 2; under 5 years, 1; congestion of lungs 1. Belfast, Me., 5,308; deaths, 2. Brattleboro, Vt., 6,000; deaths, 2; pneumonia 1. Bucyrus, Ohio, 3,950; deaths, 2; under 5 years, 2; measles 2. Calais, Me., 6,172; death, 1; consumption 1. Carrollton, Miss., 600; no deaths. Circleville, Ohio, 5,996; death, 1; under 5 years, 1; pneumonia 1. Clinton, Mich., 1,200; deaths, 2; under five years, 1; scarlet fever 1, bronchitis 1. Columbus, Ga., 10,000; no deaths. Corinth, Miss., 2,264; deaths, 2; consumption 1. Crystal Springs, Miss., 955; death, 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Gunn City, Mo., 125; no deaths. Helena, Mont., 3,630; deaths, 2; under 5 years, 1; diarrhœa 1. Hernando, Miss., 1,000; death, 1; under 5 years, 1. Huntingdon, Tenn., 1,200; death, 1. Huntingdon, Pa., 4,500; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; death, 1. Kenosha, Wis., 5,500; no deaths. La Salle, Ill., 8,885; deaths, 6; under 5 years, 3; accident 1, consumption 2, croup 1, enteric fever 1, cerebro-spinal meningitis 2. Louisiana, Mo., 5,209; death, 1; puerperal 1. Madison, Ind., 9,009; deaths, 4. Martinsburg, W. Va., 6,334; deaths, 2; consumption 2. Meridian, Miss., 4,013; no deaths. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; no deaths. Muscatine, Iowa, 8,412; deaths, 2; under 5 years, 1; scarlet fever 1. Muskegon, Mich., 11,300; death, 1; scarlet fever 1. Niles, Mich., 4,200; death, 1. Painesville, Ohio, 5,504; deaths, 3; under 5 years, 1. Pass Christian, Miss., 2,000; death, 1; consumption 1. Pearlington, Miss., 1,200; deaths, 2; pneumonia 1, puerperal 1. Pleasant Hill, Miss., 253; no deaths. Plymouth, Mich., 3,000; deaths, 2; pneumonia 1. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, 5,000; deaths, 2; under 5 years, 1; diphtheria 2. Senatobia, Miss., 935; no deaths. Springfield, Ohio, 21,000; deaths, 11; under 5 years, 4; consumption 4, diphtheria 1; whooping-cough 1. Starkville, Miss., 1,454; death, 1; consumption 1. Tampa, Fla., 749; no deaths. Titusville, Pa., 9,046; deaths, 4; consumption 1. Tuscaloosa, Ala., 2,000; no deaths. Watertown, Wis., 10,000; deaths, 7; under 5 years, 3; consumption 1, croup 1, diphtheria 1, scarlet fever 1, pneumonia 1, puerperal 1. Winchester, Va., 5,000; deaths, 6; under 5 years, 1; consumption 2, scarlet fever 1, bronchitis 1. Youngstown, Ohio, 15,421; deaths, 5; under 5 years, 1; accidents 3, cerebro-spinal meningitis 1, malarial fever 1. Total population, 298,272; deaths under 5 years, 37; total number of deaths, 106; annual rate per 1,000, 18.5.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, APRIL 23, 1881. [No. 43.

MONTHLY REVIEW FOR MARCH, 1881.

This month there is a reduction in the mean population represented of 111,385, leaving the average weekly number for the five weeks ending April 2 only 7,968,737. The month of February showed but few changes in death-rates, as compared with January, and the same uniformity is observed in March when compared with the preceding month, the usual change of weather from winter to spring having been delayed much later than usual. The mean death-rate has fallen from 23.60 to 23.22, and this slight decline is due rather to a small but general reduction of the rates of most diseases than to a marked change in any one of them. The death-rate under five years has followed the changes in the general mortality, and is 8.13 per 1,000 for March. During the month all contagious diseases have either remained stationary or declined, excepting a slight increase in measles. Of small-pox 331 deaths are reported, against 308 for February; but the 23 additional deaths may not indicate any increase in the aggregate actual mortality, reports being incomplete.

Causes of death.—It has been stated above that these show no changes worthy of note since last month for the country at large. It is only on considering the sections separately that any considerable movement is to be observed.

Distribution of diseases.—In the Northeast measles and whooping-cough have increased, but their respective rates being still only 0.19 and 0.13 per 1,000 they form no important part of the mortality. Malarial fevers and diarrhœal diseases are also more fatal, but their rates are only between 0.23 and 0.28. No increase is observed in any other disease but small-pox, from which 287 deaths are reported, against 249 in February. In Philadelphia, which contributes the largest share of deaths, only 12 have been added to the number for last month. The remaining additions have been widely distributed, and 19 cities have reported deaths this month against 14 for February. The places and deaths are as follows: North Adams, Mass., 1 death; New Britain, Conn., 1; New York, 45; Brooklyn, 3; Poughkeepsie, N. Y., 1; Hudson County, New Jersey, 14; Camden, N. J., 3; Newark, N. J., 1; Plainfield, N. J., 1; Philadelphia, 215; Pittsburgh, Pa., 2; Wilmington, Del., 1; Richmond, Va., 1; Vicksburg, Miss., 1; Brownsville, Tex., 1; Cincinnati, 2; Chicago, 31; Lake, Ill., 2; San Francisco, 2; total, 331.

Southeast section.—In this section only 7 deaths from small-pox are reported, and of these 1 are from Brownsville, Tex., showing that the epidemic is subsiding at that place. The fatal case in Vicksburg was brought from Louisville, Ky. The mortality from measles has doubled since last month, but still reaches only 0.26 per 1,000. Scarlet fever has also increased from 0.59 to 0.78, and a small increase of pulmonary diseases is observed. All others have declined, and the general death-rate of the section has fallen from 26.24 to 25.39 since last month.

Northwest section.—Here also the mortality from measles has been doubled since February, but, as in the Southeast, the disease is still unimportant; the death-rate is only 0.15 for March. Malarial fevers have increased both in the Northeast and Northwest sections, while in the Southeast their rate remains the same. Diarrhœal diseases, which have fallen 15 per cent. in the Southeast, have increased 12 per cent. in the Northeast and 20 per cent. in the Northwest. The increase is therefore not to be referred to elevation of temperature or change of diet, which causes will operate later, and begin at the South. The increased mortality in the northern sections, and especially in the Northwest, is probably due to unusual cold, and a certain epidemic tendency to gastro-intestinal diseases which was noted last month. The deaths from small-pox reported in this section are confined to Chicago and its vicinity. The general death-rate for this section has fallen from 20.12 to 20.00 since February, and remains, as usual, the lowest of the three.

QUARANTINE REGULATIONS.

PORT OF WILMINGTON, N. C., *March* 18, 1881.

The following quarantine regulations will be enforced for the port of Wilmington, and the penalty of $200 for every violation thereof strictly enforced. Pilots violating the same are liable to a loss of their branch:

To entitle a vessel to free pratique in the port of Wilmington, from whatever port she may come, she must show—

1st. A clean bill of health, in accordance with the recommendations of the National Board of Health.

2d. She must show to the satisfaction of the quarantine board that no case of infectious disease has occurred on board at the port of departure or during the passage.

3d. She must be thoroughly cleansed and disinfected and ballast discharged at the quarantine station, and perform any other requirements that may be designated by the quarantine physician.

4th. After performing all these requirements, she may receive a permit in writing from the quarantine physician, which permit must be indorsed by the superintendent of health of New Hanover County before she will be allowed to come to the city.

5th. Universal cleanliness must be preserved on board all vessels detained in quarantine—the forecastle, steerage, and cabin must be scrubbed, all foul wearing apparel and bed clothing of officers, passengers, and seamen must be washed and aired, and all infected articles destroyed, and disinfection practiced as directed by the quarantine physician.

6th. The bilge water must be pumped out twice a day, and water from alongside put in until the water pumped out shall be clear and free from any offensive smell; and wind sails must be kept up in each hatchway, and trimmed to the wind, whenever weather permits.

7th. Commanders of vessels are accountable for all irregularities committed on board their respective vessels, and for the conduct of such of their people as they may send on shore by permission of the quarantine officer; and if any person shall leave a vessel in quarantine, or go on board of such vessel without the written permission of the quarantine officer, he shall, on conviction, suffer punishment as by law provided; and all persons belonging to a vessel in quarantine, are strictly forbidden to take on board any person who did not arrive in such vessel, without a regular permit from the quarantine officer.

8th. All communications between vessels in quarantine is expressly prohibited, and no boat or craft is permitted to go alongside a vessel in quarantine, except the master thereof have a written permission from the quarantine officer.

9th. Provisions and other necessaries intended to be sent on board vessels at quarantine must follow the same rules and regulations which apply to other communications with the vessels, and all arrangements for discharging and taking in cargo must be made with the sanction of the quarantine officer.

10th. Colors must be worn and a light must be hoisted at night, so long as the vessel is detained at quarantine.

11th. All vessels upon which any case of infectious disease has occurred during their passage, or upon which any person has died; all vessels from ports known to be infected with small-pox, yellow fever, cholera, or plague shall not be permitted to approach Wilmington nearer than the quarantine station.

12th. Vessels subject to the above regulations will be designated by notice from time to time to their pilots and others interested in commerce.

13th. The quarantine season will commence on the 1st of May and end on the 1st of November, except that when sickness shall occur on board vessels at other seasons, such vessels shall also come under the above rules.

W. G. CURTIS, M. D.,
Quarantine Physician.

THOMAS F. WOOD,
Consultants.

SANITARY LEGISLATION IN CONNECTICUT.

[An act to prevent irregular medical practice.]

GENERAL ASSEMBLY,
January Session, A. D. 1881.

Be it enacted by the Senate and House of Representatives in General Assembly convened:

SECTION 1. Any transient person, not an inhabitant of this State, who shall by circular, handbill, or any other mode of advertisement, profess to treat, and shall treat, disease or injury by any drug, nostrum, manipulation, or other expedient, shall be fined twenty-five dollars for each day that he shall exercise his profession without procuring a license therefor.

SEC. 2. Selectmen in towns, and the chief officer of police in cities, may issue such licenses upon payment to the town or city treasurer by such transient person of the sum of twenty dollars for each day for which his license may be granted. The license shall distinctly state the number of days for which it shall be in force, and may be renewed at its expiration for any further time, upon the same terms. Such selectmen and chief officer of police shall record such licenses in books kept by them for that purpose, which shall be open to public inspection.

SEC. 3. This act shall not apply to commissioned surgeons in the Army or Navy of the United States, to any persons rendering gratuitous services in cases of emergency, nor to any physician or surgeon coming into this State from another State, to consult in any particular case.

SEC. 4. Prosecutions for violations of this act may be held and determined by police courts, where established, and by justices of the peace in towns in which such courts have no criminal jurisdiction

DIAGRAM REPRESENTING THE MORTALITY FOR THE MONTH OF MARCH, 1881, FROM THE FOLLOWING PLACES.

[The horizontal lines represent mortality over 5 years, the oblique lines represent mortality under 5 years; both represent total mortality per 1,000 per annum.]

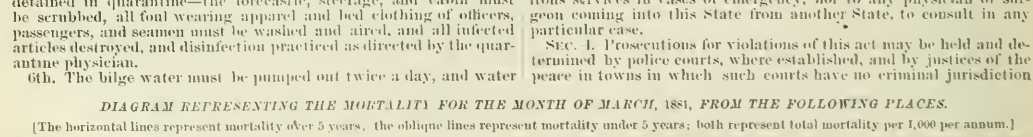

DIAGRAM TO SHOW THE PROPORTION OF DEATHS PER 1,000 PER ANNUM AS RECORDED IN THE MORTALITY REPORTS FURNISHED THE NATIONAL BOARD OF HEALTH FOR THE FIVE WEEKS ENDING MARCH 5, 12, 19, AND 26, AND APRIL 2, 1881, FROM THE FOLLOWING PLACES.

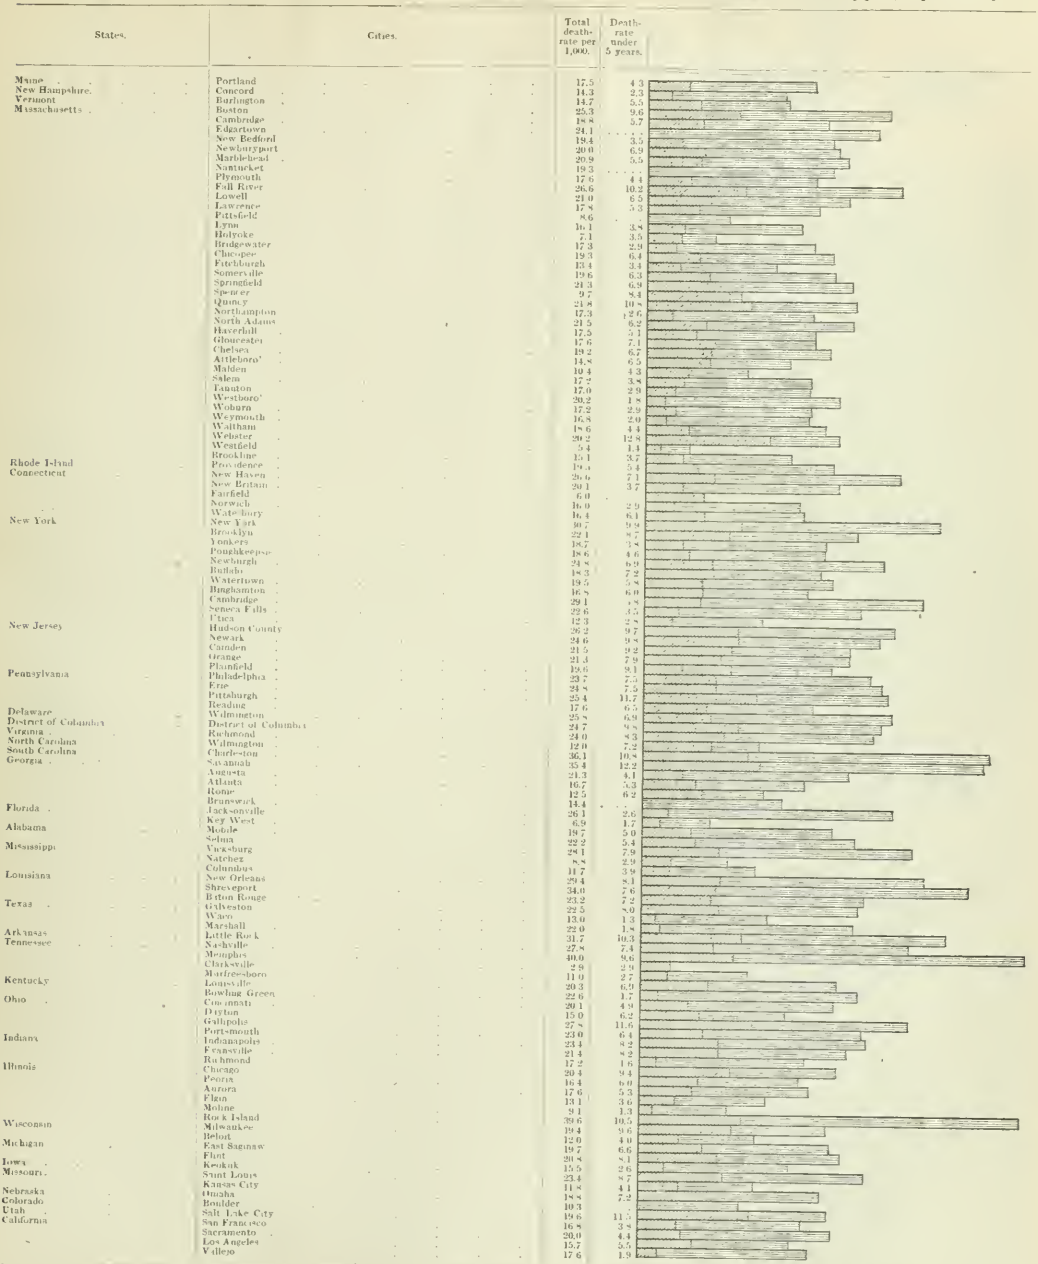
[Oblique lines represent mortality under 5 years; horizontal lines represent mortality over 5 years; both represent total mortality per 1,000 per annum.]



REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING APRIL 9, 1881.

Cities and States.	Total population according to the United States census of 1880.	Total number of deaths. ABSTRACTS FROM CONSULAR REPORTS.

BANGKOK, SIAM.—United States Consul J. A. Halderman, under date of February 21, refers to the note of his predecessor as giving the reasons, which still exist, to prevent him from supplying any accurate statistics.

Though the city has about a half a million of inhabitants it has no system of sanitary regulation, no hospitals, nor any record of mortality or disease. The dead are burned, and this cremation is usually done by the priests, in the temple grounds, for one or two dollars for those of the poorer classes. In case of epidemic and unusual mortality the bodies are left exposed in the public *salas*, or dead-houses, where they are often devoured by vultures, carrion crows, pariah dogs, or swine.

The people lead a simple life; their diet is chiefly of rice, fish, and fruit; their dress is scanty; they work only when necessity compels, and live peaceably in their Buddhist faith. Small-pox, dysentery, and malarial fevers are the prevailing diseases, but the natives do not probably show a greater rate of mortality than most of the nations who claim a higher place in the scale of civilization. In this respect they compare favorably with the small colony of foreigners who enjoy the advantages of civilized customs, food, and physic.

CONSTANTINOPLE.—Under date of March 25, United States Consul G. H. Heap writes as follows, concerning the plague on the banks of the Euphrates:

I inclose two additional telegrams relative to the plague epidemic in Irak, province of Bagdad. The returns of mortality have not yet been given, but it is evident that the disease is of the most virulent type, and if it is allowed to pass the military lines drawn around it will spread far and wide with great rapidity. Ali Meshed (or Nedjeff) is a sanctuary of great holiness to the Mohammedan sect to which the Persians belong, and they annually send great numbers of corpses there to be interred, in the belief that it secures to the souls of the deceased a favored place in heaven. A large pit is opened to receive these remains, and the emanations from this receptacle have almost invariably been followed by an epidemic of typhus fever. The bodies, which come in hundreds at a time, are wrapped in cloths and placed in rows in the vault, without being covered with earth. The Ottoman government has asked the Persian authorities to discontinue the practice of sending the bodies in a state of decomposition, and to keep them till reduced to skeletons. This ghastly trade is a source of much revenue to the caravans.

The telegrams referred to above are as follows:

1. Dr. Zitterer, under date of March 14, gives the details of the formation of the military *cordon* which is designed not only to isolate the infected district, but to prevent intercourse between the several villages and tribes in that district.

2. Under date of March 23 the inspector-general at Constantinople informs Dr. Zitterer that the sanitary council directs the extension of the *cordon* so as to cut off communication with Bagdad on the north by the road to Mossoul. The council also authorizes the employment of the physicians required to carry out the directions of the inspectors.

GIBRALTAR, SPAIN.—United States Consul H. J. Sprague, under date of March 16, states that the following quarantine regulations have been adopted by the local board of health:

1. That vessels from Egypt and Syrian ports, with clean bills of health and no sickness on board, be admitted to pratique after inspection.

2. That vessels from the above named ports with foul or doubtful bills of health shall quit the port of Gibraltar.

MARTINIQUE, WEST INDIES.—Under date of March 12, United States Consul W. H. Garfield gives the following notice concerning yellow fever:

I hereby notify the National Board of Health that several foreign vessels are leaving the island of Martinique, bound to southern ports in the United States, without having bills of health. As we have had lately some cases of yellow fever during the winter, and it is

probable that the disease will appear again during the summer. I give notice of the fact that measures may be taken to prevent the introduction of the fever into the United States.

MATANZAS, MEXICO.—Under date of April 12, United States Consul G. W. Roosevelt states that a seaman of the American brig *Atlas*, of Bucksport, Maine, was brought on shore April 6 and placed in a private hospital, where he died the next day from small-pox. The *Atlas* cleared April 12 for Philadelphia, taking a clean bill of health, as there was no sickness on board. A few cases of small-pox now exist in Matanzas.

RIGA, RUSSIA.—United States Consul P. Bornholdt reports for the month of January 414 births and 325 deaths in a population of 130,000. Annual birth-rate 37.5 per 1,000; annual death-rate 28.5.

SINGAPORE.—United States Consul A. G. Studer reports his district free from contagious or infectious diseases up to March 7.

The following reports for the week ending April 9, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 78,000; deaths, 27; under 5 years, 11; cerebro-spinal meningitis 1, consumption 4, diphtheria 2, typhoid fever 2, scarlet fever 4, pneumonia 1, bronchitis 1. Bath, Me., 8,000; deaths, 5; consumption 1, croup 1, congestion of lungs 1. Belfast, Me., 5,305; consumption 1. Bucyrus, Ohio, 3,950; deaths, 2; under 5 years, 2; measles 2. Calais, Me., 6,172; deaths, 3; under 5 years, 2; congestion of lungs 2. Carrollton, Miss., 600; death, 1. Chillicothe, Ohio, 11,000; deaths, 4; under 5 years, 1; consumption 1. Clinton, Mich., 1,200; no deaths. Columbus, Ga., 10,000; deaths, 3; under five years, 1; pneumonia 1. Corinth, Miss., 2,264; death, 1. Crystal Springs, Miss., 955; death, 1. Dallas, Tex., 10,327; deaths, 5; under 5 years, 1; consumption 3, malarial fever 1, pneumonia 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Franklin, Tenn., 2,466; death, 1. Gunn City, Mo., 150; no deaths. Helena, Mont., 3,630; deaths, 4; under 5 years, 1; pneumonia 1. Huntingdon, Tenn., 1,200; no deaths. Huntingdon, Pa., 4,500; death, 1. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; death, 1. Kenosha, Wis., 5,500; death, 1; diphtheria, 1. Madison, Ind., 9,009; deaths, 7; under 5 years, 3; cerebro-spinal meningitis 1, consumption 1, pneumonia 1, congestion of lungs 1. Martinsburg, W. Va., 6,334; deaths, 1; consumption 1. Meridian, Miss., 4,043; deaths, 2; cerebro-spinal meningitis 1. Milan, Tenn., 1,800; deaths, 2; consumption 1. Milledgeville, Ga., 3,000; no deaths. Muscatine, Iowa, 8,412; death, 1; small-pox 1. Muskegon, Mich., 11,300; deaths, 6; under 5 years, 1; consumption 1, malarial fever 1, pneumonia 2, congestion of lungs 1, puerperal 1. Niles, Mich., 4,200; death, 1. Painesville, Ohio, 5,604; death, 1. Pass Christian, Miss., 2,000; deaths, 2; consumption 1. Pearlington, Miss., 1,200; death, 1; typhoid fever 1. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; death, 1. Port Royal, S. C., 750; death, 1. Rensselaer, Ind., 900; no deaths. Senatobia, Miss., 935; no deaths. Springfield, Ohio, 21,000; deaths, 10; under 5 years, 8; consumption 1, croup 3, pneumonia 2. Starkville, Miss., 1,454; death, 1; puerperal 1. Tampa, Fla., 740; death, 1. Titusville, Pa., 9,046; no deaths. Tuscaloosa, Ala., 2,000; no deaths. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; no deaths. Winona, Minn., 10,000; deaths, 2; measles 1, puerperal 1. Youngstown, Ohio, 15,421; deaths, 5; under 5 years, 1; cerebro-spinal meningitis 1, typhoid fever 1, scarlet fever 1. Total population, 284,693; deaths under 5 years, 36; total number of deaths, 105; annual rate per 1,000, 19.2.

REPORTS OF CORRESPONDENTS.

BURLINGTON, VT., April 11.—Dr. George M. Ockford reports that during the past month the general health of the city has been very good. Scarlet fever has existed for several months, but the cases are few and of mild type. Some cases of whooping-cough have also been observed. These diseases occur chiefly among the poorer classes, many of whom live in over-crowded houses or in damp and unwholesome cellars.

HAVANA, CUBA.—During the week ending April 8 there were 32 deaths from small-pox and 21 from typhoid fever. None from yellow fever were reported.

HAVANA, CUBA.—During the week ending April 15 there were 26 deaths from small-pox and only one from yellow fever. Typhoid fever caused 29 deaths, chiefly among the natives, and the victims were mostly under 20 years of age. The physicians differ as to the true character of this so-called "typhoid fever."

VERONA, MISS.—Dr. R. C. Cunningham, health officer of Lee County, Miss., reports under date of April 9 that efforts are to be made in that county to procure the passage of an act of legislature making vaccination a pre-requisite to attendance at the public schools. Precautions are now taken against the introduction of small-pox into the county from Texas or elsewhere.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, APRIL 30, 1881. [No. 44.

SPECIAL REPORT TO NATIONAL BOARD OF HEALTH.

A fatal form of septicæmia in the rabbit, produced by the subcutaneous injection of human saliva. An experimental research [by GEO. M. STERNBERG, Surgeon U. S. Army].

In a report (not yet published) made to the National Board of Health in February last, I have given a detailed account of certain experiments, made in the first instance as a check upon experiments relating to the so-called *Bacillus malariæ* of Klebs & Tomassi-Crudelli, which show that my own saliva has remarkable virulent properties when injected into the subcutaneous connective tissue of a rabbit. Further experiments, made in the biological laboratory of the Johns Hopkins University, have fully confirmed the results heretofore obtained, and the object of the present report is to place upon record these last experiments, which are of special interest just now because of the announcement by Pasteur of "*a new disease*," produced in rabbits by the subcutaneous injection of the saliva of an infant which died of hydrophobia in one of the hospitals of Paris. (Comptes Rendus Ac. d. sc. 1881, xcii, p. 159.)

I have demonstrated by repeated experiments—

That my saliva in doses of 1.25 *c. c.*[3] *to* 1.75 *c. c.*[3] (*see note* 1) *injected into the subcutaneous connective tissue of a rabbit, infallibly produces death within forty-eight hours.*

I have commonly injected an amount varying from 5 to 25 minims, according to the size of the animal, but in small rabbits have had a fatal result in three cases out of five follow the injection of 1 minim diluted with 5 minims of water.

Query. Do similar results follow the injection of other fluids containing organic matter in suspension or solution?

Answer. One c. c.[3] of my own blood failed to kill a rabbit; 1 c. c.[3] of putrid wine containing *B. termo* in abundance failed to kill a small rabbit; 1 c. c.[3] (each) of liquid fæces and distilled water (1 to 10) failed to kill two rabbits; 1.25 c. c.[3] of bouillon undergoing putrefaction and loaded with *B. termo* failed to kill a rabbit; 1 c. c.[3] of sediment from Baltimore water, consisting of organic *débris* and organisms—chiefly *Bacillus subtilis, Leptothrix pusilla, Protococcus*, and a few diatoms and flagellate monads—failed to kill a rabbit. (Note 1.)

On the other hand, injections of a small quantity of surface mud from the gutters of New Orleans during the month of September, 1880, invariably produced fatal results within forty-eight hours. (See unpublished report above referred to.)

NOTE 1.—Coze and Feltz found, as the result of numerous experiments, that the blood of healthy persons and that of persons sick with non-infectious maladies does not produce fatal results when injected into the subcutaneous tissues of rabbits (Clinical and Exp. Researches upon Infectious Maladies, 8°, Paris, 1872). Pasteur also has inoculated, without result, the saliva of asphyxiated rabbits and of men dead with common diseases (*l. c.*).

Query. Does the saliva of other individuals injected in the same manner produce similar results?

Answer. The saliva of four students, residents of Baltimore (in March), gave negative results; eleven rabbits injected with the saliva of six individuals in Philadelphia (in January) gave eight deaths and three negative results; but in the fatal cases a less degree of virulence was shown in six cases by a more prolonged period between the date of injection and the date of death. This was three days in one, four days in four, and seven days in one.

Query. Is there any recognizable peculiarity in the saliva which exhibits the greatest degree of virulence?

Answer. In the case of Dr. S., whose saliva shows an exceptional virulence, the teeth are sound, the secretions of the month normal in physical properties and reaction, and the general health good. There is perhaps an unusual flow of saliva, but no other noticeable peculiarity.

Query. Is there any plausible hypothesis by which this difference in virulence can be explained?

Answer. This question will require for its solution more extended experiments. In the mean time it may be mentioned, as having a possible bearing upon the subject, that Dr. S. has been engaged to a considerable extent, during the past two years, in studies which have brought him in contact with septic material. Dr. F., of Philadelphia, whose saliva killed (after a longer interval) two rabbits, is pathologist to a large hospital, and consequently is constantly brought in contact with septic material. Mr. N. and Mr. B., whose saliva killed all the rabbits operated upon (four), are residents of seaport towns in Cuba. (See Note 2.)

NOTE 2.—The possibility that this septic condition of the secretions of the mouth may bear some relation to the protection which these Cubans and myself enjoy against yellow fever, which is a disease presenting many points of resemblance to septicæmia, has occurred to me, and without at present laying any great stress upon this possibility I think it worthy of further experimental consideration.

Query. Is death produced in other animals by the subcutaneous injection of human saliva which is virulent for rabbits?

Answer. Injection of 4 c. c. into each of two small dogs produced local abscesses at point of injection, but no other noticeable result. (See Note 3.) Injection of 0.25 to c. c. into five chickens produced no result. Injection of 0.75 c. c. (each) into three guinea-pigs proved fatal to two—one in three and one in seven days. Injection of 0.5 c.c. into five rats resulted fatally to one only. (See Note 4.)

NOTE 3.—A dog succumbed, however, to an injection of 1 cm[3] of serum from the subcutaneous cellular tissue of a rabbit recently dead.

NOTE 4.—The results obtained by me in these experiments correspond with those reported by Pasteur in the paper already referred to, viz, guinea-pig, less susceptible than rabbit, complete immunity of the chickens, and susceptibility of the dog to the "new disease" as the result of injections of blood from dead rabbits.

Query. What is the nature of the fatal malady produced in rabbits by the subcutaneous injection of the saliva of certain individuals?

Answer. The course of the disease and the post-mortem appearances indicate that it is a form of *septicæmia*. Immediately after the injection there is a rise of temperature which in a few hours may reach 2° to 3° centigrade (3.6° to 5.4° Fah.); the temperature subsequently falls, and shortly before death is often several degrees below the normal. There is loss of appetite and marked debility after twenty-four hours, and the animal commonly dies during the second night or early in the morning of the second day after the injection. Death results still more quickly when the blood, &c., from a rabbit recently dead is injected. Not infrequently convulsions immediately precede death.

The date and mode of death corresponds with that reported by Pasteur in the memoir referred to. Two rabbits injected with buccal mucus from the mouth of a child recently dead with hydrophobia December 11 were found dead December 13. Other rabbits inoculated with the blood and saliva of these died in still less time. Inoculations with fresh blood usually produced death in less than twenty-four hours.

The most marked pathological appearance is a diffuse inflammatory œdema or cellulitis, extending in all directions from the point of injection, but especially to the dependent portions of the body. Occasionally there is a little pus near the puncture, but usually death occurs before the cellulitis reaches the point of producing pus. The subcutaneous connective tissue contains a quantity of bloody serum, which possesses virulent properties, and which contains a multitude of micrococci. There is usually more or less inflammatory adhesion of the integument to the subjacent tissues. The liver is sometimes dark-colored and gorged with blood, but more frequently is of a lighter color than normal, and contains much fat. The spleen is either normal in appearance or enlarged and dark-colored. Changes in this organ are more marked in those cases which are of the longest duration. In certain cases dark-colored pigment has been found in the spleen resembling that which has been supposed to be characteristic of malarial fever. The blood is dark-colored, usually fluid, and there is a tendency to agglutination of the red corpuscles.

The blood commonly contains an immense number of micrococci, usually joined in pairs and having a diameter of about 0.5 μ. These are found in blood drawn from superficial veins, from arteries, and from the cavities of the heart immediately after death, and in a few cases their presence has been verified during life; observations thus far made indicate, however, that it is only during the last hours of life that these parasites multiply in the circulating fluid, and in a certain proportion of the cases a careful search has failed to reveal their presence in post-mortem examinations made immediately upon the death of the animal. This organism, however, is invariably found in great abundance in the serum which exudes in considerable quantities from the œdematous connective tissue when an incision is made through the integument over any point involved in the inflammatory œdema extending from the original puncture.

A perusal of the paper of Pasteur, already referred to, has induced me to pay special attention in three recent post mortems to some points to which this author refers, which I had not noticed in previous examinations, viz, to the condition of the trachea, the lungs, and the lymphatic glands in the groins and axillæ.

Pasteur says, "The cellular tissue is almost always emphysematous." (This

has not been observed to be the case, except to a slight extent in one instance in the rabbits operated upon by me.) "The lungs are frequently filled with *noyaux* of pulmonary apoplexy." (I have found this to be the case in one out of three rabbits examined since my attention has been directed to this point.) "A character more constant than the last (not more constant, however, than that which relates to the volume and color of the *ganglions*) is the state of the trachea, which is almost invariably red, congested, with little hemorrhages from the smallest vessels." (I have found a marked congestion of the vessels of the trachea in the three cases in which I have examined it, and in one case the lymphatic glands of the axillæ were enlarged and congested.)

Query. What constituent of the saliva injected produces the fatal malady in question?

Answer. The following facts demonstrate that *the phenomena detailed result from the presence of a living organism found in the saliva—a micrococcus—which multiplies abundantly in the subcutaneous connective tissue, and also in the blood shortly before or after death.*

(a) The poison is particulate. This is proved by numerous filtration experiments. *Example:* March 15, 11 a. m. Injected 1 c. c.[3] of filtered saliva (filtered through thin stratum of plaster of Paris by means of Sprengel's pump) into left flank of rabbit weighing 1 pound, and at the same time one-fourth the quantity of unfiltered saliva into a rabbit of the same size. No harm resulted to the first rabbit, while the second died the following day at 5.30 p. m.

(b) The virulence of the saliva is destroyed by boiling.

(c) The saliva loses its virulence when kept for twenty-four hours in a culture chamber at a temperature of 37° centigrade.

NOTE.—The presence of *B. termo* and an odor of putrefaction in saliva kept for twenty-four hours in a culture chamber shows that changes are occurring which have heretofore been recognized as destructive of the septic poison (organism), *e. g.*, the virulence of the poison which produces dangerous dissection wounds is lost when putrefaction changes set in.

(d) The addition of one part of a 10 per cent. solution of carbolic acid to two parts of saliva destroys its virulence.

(e) The effused serum from the subcutaneous connective tissue of a rabbit recently dead produces death attended with the same phenomena as resulted from the injection of the saliva in the first instance. But this does not contain epithelial cells or salivary corpuscles, and we are, therefore, justified in excluding these as possible agents in the production of the results indicated. Moreover, these are present at all times in the saliva of all individuals, while virulence, at least such an intense degree of virulence, is an exceptional property of human saliva.

(f) This serum loses its virulence by filtration.

Unfiltered serum from a recently dead rabbit has invariably proved fatal in smaller quantity and in less time than is required by the saliva in the first instance, showing an increase of virulence as the result of successive cultivation of the organism in the body of a susceptible animal. This corresponds with the results obtained by Davaine, Koch, Pasteur, and others. I have not attempted to ascertain the minimum quantity which will produce death. Davaine says, "A rabbit may be killed by the $\frac{1}{1000}$ part of a drop of septic blood." (Bull. de l'Acad. de Méd., 2 s., t. viii. p. 121.) In my filtration experiments I injected, however, quantities far in excess of the amount required to produce speedy death if unfiltered serum had been employed.

Example: March 14. Injected 2 cm³ of filtered serum (from subcutaneous connective tissue of rabbit recently dead) diluted with distilled water (1 to 20) without result, while one-quarter the quantity (5 cm³) of the same dilution *unfiltered*, injected at the same time into another rabbit, produced death in twenty-four hours.

(g) The micrococcus present in the serum from the connective tissue of a rabbit which has succumbed to a subcutaneous injection of saliva, may be cultivated in bouillion made from the flesh of a healthy rabbit, or in blood serum obtained from a healthy dog, and these fluids thereby acquire a virulence which they did not have before.

My first efforts to cultivate the micrococcus in urine, in gelatine solution, and in bouillon made from the flesh of a dog, all proved ineffectual, and these fluids after inoculation with blood or serum from the connective tissue, showed a temporary virulence only, which was doubtless due to the presence of the micrococci introduced, which preserved their vitality for a certain time, although the conditions were not favorable for their increase. After a few days the first culture lost its virulence and successive inoculations gave negative results, both as to the presence of the micrococcus and as to noxious properties when injected into rabbits.

(h) Successive cultures in which but a small drop is taken each time to inoculate a fresh quantity of bouillon exclude the white and red blood-corpuscles (filtration experiments have already shown the poison to be particulate) *as possible agents in the production of this virulence and prove conclusively that the veritable cause is the presence of a micrococcus*, found first in the saliva, then in the serum from the connective tissue and (usually) in the blood of the animal killed by the injection of saliva, and finally in each successive cultnre fluid inoculated (in the first instance) with a small quantity of this serum or blood.

Within a few hours after inoculating sterilized bouillon made from the flesh of a rabbit (first tested for several days in a culture oven at a temperature of 37° cent.) with blood, or serum from subcutaneous connective tissue of a rabbit recently dead, the fluid—previously transparent—becomes opalescent, and upon microscopical examination is found to contain innumerable micrococci, solitary, in pairs (Fig. 8), and in torula chains. The same result follows upon inoculating a second portion with a minute drop from the first, and so on. The continued virulence of these successive cultures I have amply proved.

Example: April 13. Injected 1 cm³ of bouillon culture, No. 6 (six successive inoculations, the first with serum from subcutaneous connective tissue of rabbit), into left flank of a large rabbit. *Result:* The animal was found dead on the morning of the 16th, and presented the usual appearances upon *post-mortem* examination. Its blood and the effused serum in subcutaneous connective tissue contained, as usual, an immense number of micrococci, like those already described.

Query. Does the micrococcus found under the circumstances detailed differ from the *Micrococcus septicus* of Cohn, and is it identical with the organism described by Pasteur as present in the blood of rabbits killed by the subcutaneous injection of the saliva of an infant dead from hydrophobia (l. c.)?

Answer. Cohn describes the *M. septicus* as follows:

Little rounded cells, of 0.5 μ, motionless and crowded in masses, or united in chaplets in the secretion of wounds in cases of septicæmia (Klebs), in *zooglœa* in callous ulcers, in isolated cells, united in *pairs*, or in chaplets in the serum of *epidemic puerperal fever* (Waldyer), in all the tissues, vessels etc., in cases of pyæmia and septicæmia. (The Bacteria Magnin, Little, Brown & Co., Boston, 1880, p. 76.)

Pasteur gives the following description of the micrococcus found by him in the fatal disease described by him as new, and which he evidently does not consider identical with septicæmia, a disease which he had previously studied experimentally. It should be noticed, however, that Pasteur recognizes several forms of septicæmia. Thus he says:

And now we see why septicæmia has so often been confounded with charbon: their causes are of the same order; it is a vibrio which causes septicæmia and a bacillus which produces charbon. " " " Septicæmia and putrefaction in a living being are not the same thing. *There are as many different septicæmias as there are different vibrios.* " " " In septicæmia the vibrios do not appear in the blood until the last thing, but in this liquid one of them takes a peculiar aspect, often longer than the diameter of the field of the microscope, and so transparent that it easily escapes observation; when, however, it is once perceived it is easily found again, flexible, climbing and removing the blood globules as a serpent moves the grass in the bushes, etc. (Charbon and septicæmia, C. R. Ac. des Sc., lxxxv, 101–115.)

This septic vibrio of Pasteur I found in the blood of rabbits, victims of my experiments, in New Orleans during the past summer (Report to National Board of Health, not yet published), but have not since met with it; perhaps because it develops *post mortem* and requires the hot weather of summer for its development. Whether it is an independent organism or is developed under special conditions from the *Micrococcus septicus*, being an advanced phase in the development of this organism corresponding with the spore-producing filaments which have been shown to constitute one phase in the life-history of *Bacillus anthracis* (Koch) and of *Bacterium termo* (Ewart), is an interesting question for further research. The vivid language of Pasteur describes it well, and the wonderful vigor with which this extremely slender and almost transparent organism thrusts aside the blood corpuscles in its impetuous serpentine movements cannot fail to astonish the observer. The micrococcus of Pasteur's "new disease" is, on the contrary, quite motionless, and is described as follows:

This organism is sometimes so small that it may escape a superficial observation. Its form does not differ from that of many other microscopic beings. It is an extremely short rod a little compressed towards the middle, resembling a figure 8, and of which the diameter of each half often does not exceed a half a thousandth of a millimeter (=0.5 μ and corresponding with the diameter given by Cohn for the *Micrococcus septicus*, also with the micrococcus observed by myself in the form of septicæmia described in this report). Each of these little particles is surrounded at a certain focus with a sort of auricole which corresponds perhaps to a material substance. (NOTE.—The possibility that this appearance is due to diffraction is considered, but Pasteur inclines to the opinion that in the case in question it is due to a mucous substance which surrounds the organism.)

The foregoing descriptions answer as well for the micrococcus observed by me as if they had been written especially for it, and it is unnecessary for me to say more at present in relation to the morphology of this organism, which apparently is identical with that of the *Micrococcus septicus* of Cohn, and with the organism found by Pasteur in the "new disease" described by him. Does it then follow that the organisms are identical and that the phenomena related by Pasteur as resulting from the subcutaneous injection of saliva from an infant dead of hydrophobia and by myself from the saliva of a healthy adult represent the same disease? By no means. The man of science soon finds that things which look alike are not necessarily of the same kind. Thus of two transparent colorless fluids one may be harmless water and the other a corrosive acid; two embryos apparently alike may develop the one into a man and the other into a monkey; two seeds of the same size and general appearance may produce the one a cabbage, the other a turnip, etc.

The argument, then, that because a certain bacillus, or spirillum, or micrococcus, is morphologically identical with another which is proved to be harmless as to its effects upon an animal organism, consequently it must be harmless, has no support from analogy any more than it has from experiment. And it is high time that naturalists and physicians should open their eyes to the fallacy of such an argument, as it not only has a tendency to close the minds of those who receive it to the reception of demonstrated truth, but also acts, to some extent, as a bar to the progress of science in this direction. The argument is: Bacteria are found everywhere, we eat them, we drink them, we draw their germs into our lungs at each inspiration and without apparent injury. They are evidently harmless. Your spirillum of relapsing fever does not differ (the morphological resemblance is admitted) from a harmless spirillum frequently found in the human mouth; your *Bacillus anthracis* does not differ from *Bacillus subtilis*, etc. The answer is plain. The fact that they are harmless bacteria does not disprove the possibility of pathogenic bacteria; the fact that two things look alike does not prove that they are alike; experiment proves conclusively that the phenomena of anthrax are due to the presence and multiplication in the body of the affected animal of the *Bacillus anthracis*, and that in the fatal form of septicæmia described in this report the efficient cause of the morbid phenomena and of death is the minute micrococcus described.

Doubtless, harmless micrococci abound. Pasteur finds no difference, morphologically, between the organism which produces the "new disease" described by him and that which produces the *cholera des poules*. He says: "By the form which it has in the blood the organism resembles the microbe of chicken cholera, but it differs completely in its functions. We may inoculate fowls with it without their experiencing the slightest ill effect." (The same is true of the organism producing the form of septicæmia described in this paper.) "In the form of chaplets it resembles greatly many other organisms which I have often observed," etc.

It will have been noticed from the account already given that the fatal disease in rabbits observed by me and resulting from the subcutaneous injection of my own saliva resembles in many particulars the disease described by Pasteur as new, resulting from the subcutaneous injection of the saliva of a child dead with hydrophobia. Another point of resemblance is the fact that the saliva of one of my rabbits, recently dead, has the same virulence as the blood and serum from connective tissue. A serous liquid, which in some instances escapes from the bowels shortly before or after death, also contains the micrococcus in abundance and possesses like virulence. All of these points of resemblance form a strong probability in favor of the identity of the two diseases, but I am not prepared to pronounce a positive opinion upon this point, especially since Pasteur, who had previously given much attention to the study of septicæmia, pronounces the disease observed by him to be new, while I see no reason, at present, for supposing that the disease observed by me differs essentially from the experimental septicæmia produced by Davaine, Koch, and other investigators, who, however, obtained their first supply of septic organisms from a different source.

In the light of what we already know, it seems very probable that puerperal fever, hospital gangrene, and the various forms of septicæmia known to physicians and surgeons result from the development of pathogenic varieties of harmless and widely-distributed species of micrococci, as the result of especially favorable surroundings, such as are found in the lochial discharges of a puerperal woman or in the secretions from the surface of wounds in a crowded and illy-ventilated hospital ward.

Just as differences in resisting power to experimental septicæmia are exhibited by different species of animals, so doubtless individual differences exist in man, especially as the result of lowered vitality; and this want of resisting power, from whatever cause resulting, must be counted as one of the conditions favorable to the development and propagation of a pathogenic bacterium. Thus we find that in experimental septicæmia the micrococcus does not invade the blood until the vital powers are at a low ebb, and death is near at hand.*

In the dog the vital resistence is competent to withstand the assaults of a micrococcus—injected subcutaneously—having the potency of those found in my saliva, and the result of such an injection is simply a circumscribed abcess. But the increased power (which is perhaps simply a more vigorous and rapid development) gained by cultivation in the body of the rabbit, enables these organisms to overcome the resistence of the dog, and a diffuse cellulitis results of fatal character.

The fact, observed by myself, that during the summer months the mud in the gutters of New Orleans possesses an extraordinary degree of virulence † shows that pathogenic varieties of bacteria are not alone bred in the bodies of living animals. The more I study this subject the more probable it seems to me that in this direction lies the explanation of many problems which have puzzled epidemiologists, and that the sanitarians are right in fighting against filth as a prime factor in the production of epidemics—a factor of which the *rôle* is easily understood, if this view is correct.

The presence of septic organisms, possessing different degrees of virulence depending upon the abundance and kind of pabulum furnished them and upon meterological conditions more or less favorable, constitutes, in my opinion, the *epidemic constitution of the atmosphere*, which wise men were wont to speak of not many years ago as a cloak for ignorance. It must be remembered that the gutter mud of to-day, with its deadly septic organisms, is the dust of to-morrow, which in respiration is deposited upon the mucous membrane of the respiratory passages of those who breathe the air loaded with it. Whether the peculiar poison of each specific disease is of the same nature or not—a question which can only be settled by extended experimental investigations in the future—it is altogether probable that this factor often gives a malignant character to epidemics of diseases which uncomplicated are of a comparatively trivial nature.

*By virtue of some property or mechanism at present unknown, blood, which external to the body is a favorable medium for the development of many species of bacteria, resists their entrance or gets rid of them when they effect an entrance, *e. g.*, by injection, so long as it is circulating in the vessels of a healthy individual.

† There is no reason to suppose that this is peculiar to New Orleans, but I have not yet had the opportunity to extend my experiments to other places.

NOTICE OF QUARANTINE.

The Department of State has been notified by the United States consul at Aden, Arabia, under date of March 19, that in consequence of the outbreak of plague in Mesopotamia, all vessels arriving at Aden from ports on the Persian Gulf, with clean bills of health, will be subject to a quarantine of seven days.

PROPOSED SANITARY LEGISLATION IN CANADA.

The following plan of registration of vital statistics is offered by Thomas H. Monk, esq., of Toronto, Canada:

Outline of a scheme for the registration of the state of health, showing: 1st. The information which it is proposed to obtain; 2d. The method in which it is to be obtained; 3d. How it is to be utilized; 4th. The benefits which will be derived from it. Prepared by Thomas H. Monk, esq., of Toronto, Canada.

1. *The information it is proposed to obtain.*

A.—A statement of the number of cases of each disease coming under the notice of the physician reporting. The form on which this report is made is so arranged that the number of old cases, *i. e.*, of persons who were taken sick *previous* to the week for which the report is made, and their progress is given; as well as the number of new cases, *i. e.*, of persons taken sick *during* the week for which the report is made, and the severity of the disease. The age of the person afflicted will also be given, and it will be stated whether the disease terminated in recovery or death. We shall therefore have here a record of the inception, progress, and termination of every case of disease reported.

B.—An endeavor will be made to accumulate facts regarding the peculiar features of the locality, which will be useful in discussing the above reports, such as the drainage of the locality, the aspect of the towns, cities, and villages, the water supply, the kind of soil and general topographical features of the district, and such other points as may influence the sanitary condition and health of the inhabitants.

2. *The method in which it is to be obtained.*

A.—Forms for reporting every week will be sent to such physicians as express a willingness to co-operate. This form (*a*) will be so arranged that each person reporting will be able to keep a copy of his report. In order to avoid unnecessary trouble in looking through his private books for the purpose of obtaining the information for the report, another form (*b*) will be supplied. It will then be comparatively easy to enter every day the cases which have been attended. This will undoubtedly increase the accuracy of the reports, as there will be no difficulty in entering the *casual* cases of disease which may only come under notice once, and of which, in many instances, no other record would be kept. This form will not be returned to the central office; but is merely a daily blotter for the convenience of the practitioner.

B.—In order to obtain information regarding the topographical and other features of the various localities, the circulars first issued will be accompanied by a form, the return of which, when filled in, will give the data required.

C.—Remarks regarding any change in the sanitary condition, or concerning any special disease, will be noted on the regular weekly form.

3. *How it is to be utilized.*

A review of the reports received will be issued every two weeks, stating the diseases which are most prevalent in the different localities. For this purpose each province will be divided into districts, and special reports will be made for each district. It will also be stated whether the number of cases of the disease has increased or not since the previous report. Special attention will be devoted to pointing out the existence of contagious and infectious diseases, and such information will be given relative to public health as may be considered of service to all interested therein. Copies of this review will be furnished to the minister of agriculture, to the secretary or president of each medical society, to the mayors and health officers of each city, town, or municipality, as well as to every physician reporting. It will not be necessary to wait for the publication of these fortnightly reviews when an epidemic prevails in any locality, as a special report regarding the increase or decrease in the amount of sickness will be forwarded to all interested persons as soon as possible after the receipt of the weekly returns. An annual report will be prepared for the information of the government, which will contain a digest of all the reports received during the year; and disease charts may also be prepared to accompany this report, showing the most prevalent diseases in the different localities. The data contained in the report will also be compared with the meteorological returns, so that the influence of the weather may be investigated.

4. *The benefits which will be derived from it.*

It is obvious that the observations of a single person regarding the prevalence of disease may be wholly at fault. It is only by the accumulated experience of a large number of physicians that we can arrive at correct information on these points. The reports being collected, compiled, and discussed at some central office, and the results published, must prove of great service. It is by no means improbable that the health officers in the cities, towns, and municipalities, on receipt of these reports, will become sufficiently alive to the importance of taking action, wherever and whenever required, for the protection of public health; and it is not unlikely that a spirit of emulation will thus be aroused which will ultimately lead to the most beneficial results. The knowledge that the prevalence of an epi-

demic in their locality has been publicly proclaimed will undoubtedly lead them to take action to prevent its spread, not only for the benefit of humanity, but for their own credit. When the population of each district has been ascertained it will be a comparatively easy task to obtain from these reports the relative proportion of sickness from any disease. This would be most useful in showing the districts in which diseases are more or less than usually prevalent. We shall thus be able to point out to the general public, as well as those interested, the localities which are most free from any special disease; so that persons afflicted with, or predisposed to, diseases such as consumption, rheumatism, malarial and other fevers, &c., may learn in which places there is the greatest likelihood of their recovery, or where they will be removed from those influences which tend to a protraction or increase in severity of such diseases. That this information is desired is shown by the fact that questions have already been asked on this point. The influence of locality in producing or modifying the effects of any special disease is one of the most important features in this investigation.

As the returns state the ages of the persons afflicted with the disease named, we shall have a basis for showing the probability of attack, recovery, or death from the different diseases in the various stages of life. It will be possible to give the proportion between the sickness-rate and the death-rate from the different diseases at certain ages. This will be most important in tracing out the causes of the large mortality among children.

The interchange of such reports with the authorities in the United States will give us a knowledge of the contagious or infectious diseases which may prevail there, and thus enable us to take precautions to prevent their introduction into Canada.

One important result to be attained from the accumulation and discussion of these statistics, will be the knowledge we shall gain of the influence of the weather on health. That the changes of the weather are remarkably connected with the varying death-rate, has been ably shown by Alex. Buchan, secretary of the Scottish Meteorological Society, and Dr. Arthur Mitchell, in their discussion of the mortality of London, England, and New York; but the exact influence they have on the inception and progress of disease has never been satisfactorily ascertained, as we have had no data to go upon. When this influence has been ascertained, our knowledge of the coming weather will be of great service. That some such system of health registration is needed, is shown by the fact that the medical societies in Toronto, Montreal, Hamilton, and London, the only ones before whom the subject has been brought, have unanimously accorded it their support. They all feel the truth of a remark of a distinguished writer on sanitary reform—Right Hon. Lyon Playfair, F. R. S.—that "registration of deaths represents the wrecks which strew the shore, while that of sickness would tell us of coming storms and enable us to trim our vessels to meet them. Till we have such a system of disease-registration, public health cannot be administered with full intelligence."

SKETCH OF FORM A.

List of diseases.	Cases brought forward from last week.	Progress.	New cases.	Severity.	Total number of cases in week.	Terminated in recovery.	Terminated in death.	List of diseases.	Cases brought forward from last week.	Progress.	New cases.	Severity.	Total number of cases in week	Age. Under 1.	1 to 5.	5 to 15.	15 to 30.	30 to 60.	Over 60.	Terminated in recovery.	Terminated in death.	Remarks.

Brain, inflammation of								
Bronchitis (acnte)								
" (chronic)..								
&c., &c.								

SANITARY LEGISLATION IN ARKANSAS.

Dr. J. A. Dibrell, under date of March 25, 1881, furnishes the following act of the general assembly of the State of Arkansas. The date of the act is not given:

AN ACT TO ESTABLISH A STATE BOARD OF HEALTH.

Be it enacted by the general assembly of the State of Arkansas:

SECTION 1. Within thirty days after the passage of this act the governor shall appoint six State commissioners of health, a majority of whom shall be gradnates of legally constituted medical colleges, and of not less than seven years' practice of their profession in the State of Arkansas. The acceptance of an appointment on the State board shall not in any way invalidate or affect the official position of any officer in his local board, and shall not be construed to vacate his office in his local board.

SEC. 2. The said commissioners, so appointed, shall take the oath of office prescribed by the constitution for State officers, and receive from the secretary of state certificates of their appointments. They shall hold their office for two years, unless discharged for good cause. When a vacancy occurs the governor shall fill such vacancy as soon as the fact comes to his knowledge.

SEC. 3. The State board of health shall meet at least once in every three months, and as much oftener as they shall deem necessary. No member of the board except the secretary shall receive any pay, but the actual traveling expenses of the members and officers of said board, while engaged in their duties, shall be allowed and paid out of the appropriation made for its support. They shall elect, annually, one member of the board to be president. They shall also elect, from their number or otherwise, a person of skill and experience in public health duties and sanitary science to be the secretary and executive officer of said board, who shall have all the powers and privileges of a member of the board, except in regard to voting upon matters relating to his own office and duties as secretary, and he shall hold said office for two years. But he may be removed for cause, after a full hearing by the board, a majority of members voting therefor.

SEC. 4. The State board of health may adopt by-laws regulating the transactions of its business, and provide therein for the appointment of committees, to whom it shall delegate authority and power for the work committed to them, and it may also adopt and use an official seal. Four members may constitute a quorum for the transaction of business.

SEC. 5. The secretary shall keep a record of the acts and proceedings of the board, perform and superintend the work prescribed in this act, and such other duties as the board may order.

SEC. 6. Said board shall take cognizance of the interests of health and life among the people of the State. They shall make inquiries in respect to the causes of disease, and especially epidemics, and investigate the sources of mortality and the effects of localities, employments, and other conditions upon the public health. It shall be the duty of said board to obtain, collect, and preserve such information relating to deaths, diseases, and health as may be useful in the discharge of its duties, and contribute to the promotion of the health or the security of life in the State. And it shall be the duty of all health officers and boards of health in the State to communicate to said State board of health copies of all their reports and publications, also such sanitary information as may be useful.

SEC. 7. It shall be the duty of the State board of health to have the general supervision of the State system of registration of births, marriages, and deaths, and also the registration of prevalent diseases. Said board shall prepare the necessary methods and forms for obtaining and preserving such records, and to insure the faithful registration of the same in the several counties. The said board of health shall recommend such forms and amendments of law as shall be deemed to be necessary for the thorough organization and efficiency of the registration of vital statistics throughout the State. The secretary of said board of health shall be the superintendent of registration of vital statistics of the State, as supervised by the said board. The clerical duties and safe keeping of the bureau of vital statistics thus created shall be provided for by the secretary of state, who shall also provide and furnish such apartment and stationery as said board shall require in the discharge of its duties. And the State board of health shall also prepare the necessary methods and forms, and prescribe the rules regulating the issue and use of transfer permits, with the proper coupons attached thereto, to be issued by local organized boards of health, for the transportation of the dead bodies of persons which are to be carried for burial beyond the limits of the counties where the death occurred, and in all cases the said State board of health shall require coupons to be attached to such permits, to be detached and preserved by every common carrier, or the person in charge of any vessel, railroad train, or vehicle to whom such dead bodies shall be delivered for transportion. Any violation of such rules and regulations shall be a misdemeanor.

SEC. 8. At any time the governor of the State may require the State board of health to examine into nuisances or questions affecting the security of life and health in any locality, and in such case the said board shall have all necessary powers to make such examinations, and it shall report the results thereof to the governor within the limits of the time which he shall prescribe for such examination

and report. The report of such examination, when approved by the governor, shall be filed in the office of the secretary of state, and the governor may, in relation to the matters or things found and certified by the State board of health to be a nuisance, declare them to be nuisances, and order them to be changed as he shall direct, or abated and removed. Any violation of such an order shall be held and punished as a misdemeanor, and thereafter the governor may by his order in writing, certified under his official seal, directed to the officers of the county in which the said nuisance shall be situated, require the district attorney, the sheriff, and other officers of every such county to take all necessary measures to execute and have obeyed the order of the governor.

SEC. 9. At any time, at the request of the State board of health, or whenever the governor shall, as heretofore provided, have directed an examination and report to be made by the State board of health into any alleged nuisance, any board of health of any city of the State may appoint and select any one of its officers as its representative during such examination of any nuisance, and such representative officer shall have a seat at and be entitled to take part in all the deliberations of the State board of health during such investigation, but without the right to vote.

SEC. 10. Said board may, from time to time, engage suitable persons to render sanitary service and to make or supervise practical and scientific investigations and examinations requiring expert skill, and to prepare plans and report relative thereto. And it is hereby made the duty of all officers and agents having the control, charge, or custody of any public structure, work, ground, or erection, or of any plan, description, outlines, drawings, or charts thereof, or relating thereto, made, kept, or controlled under any public authority, to permit and facilitate the examination and inspection; and the making of copies of the same by any officer or person by said board authorized, and the members of said board, and such other officers or persons as may at any time be by said board authorized, may, without fee or hindrance, enter, examine, and survey all grounds, erections, vehicles, structures, apartments, buildings, and plans whereby the public health may be promoted, or in any wise preserved.

SEC. 11. It shall be the duty of said board, on or before the first of December in each year, to make a report in writing to the governor of the State upon the vital statistics and the sanitary condition and prosperity of the State; and such report shall set forth the action of said board and its officers and agents, and the names thereof for the past year, and may contain other useful information, and shall suggest any further or additional legislation, action, or precautions deemed proper for the public health, or for the better protection of life and health. And the annual report of said board shall also contain a detailed statement of all money paid out by or on account of said board, and a detailed statement of the manner of its expenditure during the year last past.

SEC. 12. The salary of the secretary of the board of health shall be, per annum, one thousand dollars, to be paid out of the amount hereinafter provided for the same and for the maintenance of said board of health.

SEC. 13. And that the sum of three thousand dollars be, and the same is hereby, appropriated for the payment of the salary of the secretary of the board of health and the expenses incident to the proper working of said board of health.

SEC. 14. And that this act take effect and be in force from and after its passage.

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

By STEPHEN SMITH, A. M., M. D., of New York.

MASSACHUSETTS.*

From the settlement of Boston in the year 1630, until the year 1647 (though frequent orders were passed by the "townsmen," regulating the internal health of the town), no measures were taken either by the government of Boston, or general court of the colony, to prohibit vessels from landing, having cases of infectious sickness on board, or coming from infected ports.

Information having reached the colony of Massachusetts Bay that the "plague, or like grievous infectious disease," had "raged exceedingly in the Barbadoes, and other islands of the West Indies," and the colony trading with them at the same time, it was considered highly expedient to enforce some measures to prevent the introduction of a disease so fatal in character. Accordingly the general court, in March, 1647 or 1648, passed their first order regulating quarantine of vessels from the aforesaid ports. This order (a copy of which is appended) was temporary in character, and repealed in about one year afterwards, probably on the termination of the epidemic.

First order of General court, regulating quarantine of vessels passed at a session of the general court the first month (March) 1647 or 1648.

For asmuch as this Co^rte is credibly informed y^t y^e plague, or like grievos in (fectious) disease, hath lately exceed^{gly} raged in y^e Bardadoes, Christophers, & oth^{rs} i (slands) in y^e West Indies, to y^e great depoplat^g of those, it is therefore ord^red, y^t all (our own) or oth^r vessels come^g from any p^ts of y^e West Indies to Boston harbor shall stop (and [*200] come to an) anchor before they come at y^e Castle, und^r y^e poenalty of 100l, & that no p^son comeing in any vessell from the West Indies shall go ashore in any towne, village, or farme, or come within foure rods of any oth^r p^son, but such as belongs to the vessels company y^t hee or shee came in, or any wayes land or convey any goods brought in any such vessels to any towne, village, or farme aforesaid, or any oth^r place w^thin this jurisdiction, except it be upon some iland where no inhabitant resides, w^thout license from y^e councell, or some three of them, und^r y^e aforesaid poenalty of a hundred pound for ev^ry offence.

That no inhabitant, seaman, or other p^son whatsoev^r, reciding w^thin this jurisdiction, shall go a board any such shipp or vessell comeing from the West Indies aforesaid, or buy or otherwise take into his possession any goods or marchandize brought in any such vessell, w^thout license as aforesaid, und^r y^e poenalty of 100l, & to be otherwise confined or restrained, as the said councell, or some three of them, shall appoint; & to y^e end y^t all p^sons may have due information hereof, it is hereby agreed, y^t this ord^r shalbe forth w^th published, & a coppy thereof sent to y^e Captaine of y^e Castle, togeth^r w^th commission to him to cause ev^ry shipp or other vessell, belonging to y^e country or any oth^r place, y^t shall come from any p^t of the West Indies aforesaid, to stop & come to an anchor before they shall passe y^e Castle, & then send unto them a coppy of this order, & there cause them to remaine till furth^r order from y^e Councell, or some three of them, whose counsell is to be taken therein; this ord^r to continue till this Co^rte or the Councell of y^e comon wealth shall see cause to repeal^r y^e same.

It is furth^r ord^red, y^t a coppy of this order shall beforthw^th sent to the sev^rall cunstables of ev^ry port towne in this jurisdiction, w^th warrant to give notice thereof, w^th all possible speed, to any vessell comeing from y^e West Indies aforesaid, upon y^e first view thereof, and furth^r to see to y^e execution of this ord^r, according to y^e utmost of their ability, & y^t y^e Councell, or some three of them, shall have pow^r to appoint some convenient place, upon some of y^e ilands or other fit places, where such p^sons & goods shalbe sheltered for a time, & to do any thing of like nature y^t shall be necessary for their preservation, and welfare of y^e country.

This order was repealed on 2d May, 1649, as follows:

"The Courte doth thinke meete that the order concerning the stoping of West India ships at the Castle should hereby be repealed, seeing it hath pleased God to stay the sicknes there."

After the repeal of the order in the year 1649, no quarantine was imposed on vessels until 1665. This year ushered in what is popularly known as the great plague in London, or scientifically as typhus fever. Its ravages had been great, and owing to the commercial intercourse between England and the Colony of Massachusetts Bay, it was deemed necessary to place restriction on vessels coming therefrom. Accordingly the following order from the General Court, held at Boston, was passed the 11th of October, 1665. It was intended, like the first order, to be of a temporary character, and was repealed on the 9th of October, 1667. In both cases, the quarantine grounds were adjacent to the Castle, and permission to land either passengers or goods had to be obtained from the governor or council.

11 October [*554.]

Att the Sessions of the Generall Court held at Boston, 11^th of October, 1665.

. . . . . .

Itt is ordered, that a warrant forthwith issued out from this Court to M^r. W^m. Foster, that he land no goods nor persons till this Court take ffurther order, or that he receive order from the Gouno^r & major generall, or Deputy Gou^no^r & M^r. Russell; nor shall any person whatsoever goe on board him or any such vessell w^thout suchlike licence, on penalty of Imprison ment, that so the dainger of the pestince may be prevented as much as maybe; & that the captaine of the Castle stop all vessells coming from England, and bring them to an anchor, till they, as aforesaid, shall give order for their coming vp & landing of their goods, that so wee may be found in all due wayes subservient to Providence for the preventing infection by the pestilence. Warrants issued out accordingly to y^e capt of y^e Castle & M^r Foster, w^ch are on file.

This order remained in force nearly two years. The following is a repeal of the same:

Att a second Sessions of the Generall Court of Election, held at Boston 9^th of October 1667.

There being an order made in October, 1665, injoyning the capt of

*For a collection of the acts relating to the establishment of quarantine of Massachusetts, from the settlement of the colony of Massachusetts Bay to the present time, we are indebted to Dr. Samuel H. Durgin, M. D., George F. Babbitt, and James F. Keith, commissioners of health. Their report is prefaced by the following note: "The material for the history of quarantine at the port of Boston from the time of its establishment to the present, covering a period of two hundred and thirty-four years, has been so difficult of access, and scattered through so many volumes, that for the sake of convenience of reference and preservation the Board of Health has caused to be copied from the State and city records all that can be found pertaining thereto."

the Castle to stop all shipps coming from England, for the prevention of the spreading of infection, it is ordered, that that law shall & hereby is repealed.

The Records of the Governor and Company of the Massachusetts Bay in New England, edited by Dr. Shurtleff, terminated in the year 1686. In chap. 87, of acts and resolves for the year 1867, it was resolved:

"That the Governor with the consent of the Council, be authorized to cause to be prepared for publication, the Acts and Laws of the late province of Massachusetts Bay, with such of the laws and orders recorded in the General Court as are of legal and historical importance, from the arrival of the province charter, in the year sixteen hundred and ninety-two, to the seventeenth of June, in the year seventeen hundred and seventy-four." . . .

From the end of the records edited by Dr. Shurtleff, until the beginning of the publication called for by the above resolve, it will be seen that there is an interval of about six years. During the greater part of this period the records are meagre, owing to political troubles. Those preserved in the State Library contain no trace of any quarantine law.

On the 18th of July, 1700, an act was passed entitled "An act for the better preventing of the spreading of infectious sicknesses," as follows:

Whereas ships and other vessels arriving within this province, from parts beyond the seas, are ofttimes during their passage visited with the small pox, and other infectious sicknesses, or come from places where such sicknesses are prevailing and epidemical, bringing with them cotton wool or other commodities in which the contagion is liable to be conveyed, and has in time past proved to be of pernicious and fatal consequence to the people of this province, the masters or commanders of such ships or vessels, not taking that due care as in such case they ought, to give information thereof before they bring their ships into harbour, and have landed their passengers or goods; for prevention of which mischief for future, and that this province by the blessing of God may be preserved from the coming in and spreading of contagious mortal sicknesses:—

Be it enacted by His Excellency the Governour, Council and Representatives in General Court assembled, and by the authority of the same,

SECTION 1. That no master or commander of any ship or vessel arriving to any port or harbour within this province, in which ship or other vessel, any person, passenger or seaman upon their passage shall be visited with the small pox or any other contagious sickness, or shall come from any port or place where any such sickness is epidemical and prevailing, may presume to sail or bring his ship or vessel within or above the castle or fort (where any such is), or within the space of half a mile next unto any peer, wharf or landing-place in such harbour where no fortification is, without license first had for so doing from the governour or commander-in-chief of this province for the time being, or from the two next justices of the peace, if such harbour lye more than ten miles distant from the place of the governour's residence, nor shall permit or suffer any of his passengers or seamen to be landed or brought on shore, or any person or persons to come on board without licence as aforesaid first had and obtained for the same, on pain that every master or commander of any ship or other vessel offending against this act shall forfeit unto his majesty the sum of one hundred pounds for and towards the support of the government of this province, to be recovered by action, bill, plaint or information in any of his majesty's courts of record within the same, wherein no essoign, protection or wager of law to be allowed.

SECT. 2. And, to the intent that all masters or commanders of ships or other vessels not belonging to this province may be duly informed of their duty by this act required, the captain of the castle, and the chief officer of every other fort or fortification in any other port or harbour within the same, are hereby commanded or enjoyned to examine and enquire of the health of all ships and other vessels arriving to the same, and to acquaint the masters or commanders thereof of the import of this act.

And be it further enacted by the authority aforesaid,

SECT. 3. That if any passengers or seamen arriving in any ship or vessel, visited with the small pox or other pestilential or infectious sicknesses upon her voyage, shall presume to come on shore before license had as aforesaid, it shall and may be lawful to and for any justice of the peace to require or send such person or persons, with their cloathing and bedding, or board such vessel again, or to confine them to such other place or places as such justice shall judge most suitable for preventing of infection; and all the cost and charges arising thereupon to be answered and paid by the passenger or seaman so offending as aforesaid, who also shall forfeit the sum of twenty pounds to the use aforesaid and to be recovered in manner as aforesaid. [*Passed and published July* 18.]

[This article will be continued in a future BULLETIN.]

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING APRIL 16, 1881.

States and Cities.	Total population, according to the United States census of 1880.	Total number of deaths. ABSTRACTS FROM CONSULAR REPORTS.

CONSTANTINOPLE.—United States Consul G. H. Heap reports, under date of March 28, that the epidemic of small-pox in the city is at an end, no deaths having been reported for three weeks. A few sporadic cases are still observed, but these almost always exist in Constantinople.

The following extracts are made from the telegrams relating to the plague in Persia:

1. *March* 21.—Dr. Zitterer states that the authorities have responded readily to the orders of the Porte, and given all the aid in their power to the execution of sanitary measures directed by the council. In the village of Kuffé nine huts were burned, and also a quantity of infected clothing, &c. Evacuation of the place was then enforced, and the people compelled to submit to general disinfection. From 15 to 18 deaths per day are reported at Nedjeff.

2. *March* 22.—Having proceeded to Nedjeff, Dr. Zitterer reports the plague increasing in two quarters of that town. During the three days ending March 21, there were 116 new cases and 66 deaths reported. In one house 10 out of 12 persons died; in others, whole families perished. The disease increases at Djaara, where 12 to 14 deaths per day are reported, and those attacked are not cared for.

3. *March* 23.—Forty-nine new cases and 26 deaths at Nedjeff. Later advices include a telegram from Dr. Bartoletti, inspector-general, to Dr. Zitterer, dated March 30, authorizing the most stringent measures, and especially the destruction by fire of all infected houses and personal property.

The consul also forwards a copy of an agreement made December 8, 1872, between the Turkish and Persian Governments, by which Persian subjects who desired to use the sacred ground of certain places near Bagdad were obliged to bury their dead at home for three years, and record the date of the death. At the end of that time a certificate from the proper authorities would permit the transportation of the remains, and without such certificate no corpses were to be removed.

The letter of Dr. Matteosian, with later advices from Dr. Zitterer, will be given in the next number of the BULLETIN.

SANDWICH ISLANDS.—United States Consul D. A. McKinly forwards the report of mortality in Honolulu for the month of February. There were 74 deaths, of which 13 were under 1 year, 21 under 5 years, and 8 over sixty years of age. Among the causes of death were: Consumption 8, other lung diseases 2, diarrhœal diseases 2, small-pox 32. It is evident that the last-named disease is epidemic, and is increasing, as the report for the week ending March 1 gives 17 deaths, or more than one-half of the total for the month from small-pox. Total number of cases reported to date, 219; deaths, 33.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—The report of Dr. J. M. Main, for the month of March, shows 7 deaths from small-pox, all under 17 years of age; the mortality from other diseases and the death-rate for the month will appear in the table of monthly reports.

DUBUQUE, IOWA.—The financial report for the year ending February 28, 1881, gives also the following vital statistics: Population, 22,254; births, 572; annual birth-rate, 25.7. Deaths, 266; annual death-rate, 12.0 per 1,000. Of the total of deaths 233, or 88 per cent., were from "infectious diseases," divided as follows: Diphtheria, 47; erysipelas, 8; croup, 14; measles, 9; puerperal fever, 7; scarlet fever, 117; typhoid fever, 12; varicella, 1; whooping cough, 18; total, 233. Scarlet fever caused 44 per cent. of all deaths, and was epidemic from October to the close of the year reported, showing a decrease in February.

PERU, IND.—The report of the local board of health for the first quarter of 1881 gives a total of 42 deaths, of which 20 were under

Clinton, Mich., 1,200; no deaths. Coldwater, Mich., 4,800; deaths, 3; under 5 years, 1: accident 1, cerebro-spinal meningitis 1, pneumonia 1. Corinth, Miss., 2,264: deaths, 2: pneumonia 2. Crystal Springs, Miss., 955; no deaths. Dallas, Tex., 10,327: deaths, 3; under 5 years, 1: cerebro-spinal meningitis 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Greenville, S. C., 6,159; deaths, 3; under 5 years, 1; consumption 1, congestion of lungs 1, puerperal 1. Gunn City, Mo., 125; no deaths. Hernando, Miss., 1,000; no deaths. Huntingdon, Pa., 4,500; death, 1: pneumonia 1. Huntingdon, Tenn., 1,200; one death. Iuka, Miss., 846; death, 1; consumption 1. Jefferson, Tex., 3,250; death, 1; under 5 years, 1. La Salle, Ill., 8,885; deaths, 5; under 5 years, 2; cerebro-spinal meningitis 4, accident 1. Louisiana, Mo., 5,000: deaths, 2; consumption 1. Madison, Ind., 8,945; deaths, 12; under 5 years, 4; congestion of lungs 3, bronchitis 1, pleurisy 1. Martinsburg, W. Va., 6,384; deaths, 2; consumption 1, typhoid fever 1. Milan, Tenn., 1,800; death 1; pneumonia 1. Milledgeville, Ga., 3,000; one death. Muscatine, Iowa, 8,412; deaths, 2; under 5 years, 1; cerebro-spinal meningitis 1, scarlet fever 1. Muskegon, Mich., 11,300; deaths, 10; under 5 years, 2; consumption 2, diphtheria 2, typhoid fever 1, malarial fever 1, pneumonia 1, congestion of lungs 1, puerperal 1. Niles, Mich., 4,200; death, 1; bronchitis 1. Ocala, Fla., 1,000; no deaths. Painesville, Ohio, 5,504; deaths, 2; consumption 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; one death. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; one death. Santa Cruz, Cal., 5,000; no deaths. Senatobia, Miss., 935; no deaths. Springfield, Ohio, 21,000; deaths, 16; under 5 years, 5; consumption 4, diarrhœa 1, croup 1, diphtheria 1, pleurisy 2, puerperal 1. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; no deaths. Tuskaloosa, Ala., 2,000; no deaths. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; deaths, 3; consumption 1. Winona, Minn., 10,000; death, 1; consumption 1. Youngstown, Ohio, 14,521; deaths, 7; under 5 years, 2; accident 1, cerebro-spinal meningitis 2, bronchitis 2. Total population, 304,782; deaths under 5 years, 57; total number of deaths, 151; annual rate per 1,000, 25.8.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MAY 7, 1881. [No. 45.

QUARANTINE PROCLAMATION FOR PORTS IN THE STATE OF TEXAS.

EXECUTIVE OFFICE, AUSTIN, TEX., *April* 26, 1881.

Be it known that I, O. M. Roberts, by the authority vested in me as governor, by the laws of this State, do hereby declare quarantine to exist, and to be enforced on the coast of Texas, at the stations hereinafter mentioned, to commence from and after the 1st day of May, A. D. 1881, and continue until closed or modified by directions of the governor:

First—Said quarantine shall be applied to all vessels sailing from or touching at any port or place infected by disease that is liable to be carried by said vessels, their passengers, cargoes, or crews, and entering a port of Texas.

Second—Said quarantine shall be applied to *all vessels* sailing from or touching at *any port or place* south of north latitude twenty-five degrees and entering a Texas port, unless it be some particular port or ports where no infectious disease exists, satisfactory evidence of which must be sent to this office beforehand, and *exemption* so declared by the governor.

Third—The said quarantine is to be enforced under the following rules:

RULE 1. All vessels arriving at any of said coast stations shall come to anchor, and not be allowed to weigh anchor until boarded by the quarantine officer of the station and *free pratique* is granted by said officer.

RULE 2. It shall be the duty of the quarantine officer to detain vessels long enough for thorough inspection, and to ascertain every possible fact pertaining to their sanitary conditions that might endanger the inhabitants of this State. Vessels from an infected place, with clean bills of health, and having had no sickness of an infectious kind *en route*, shall be detained, and subjected to processes for purification, a sufficient number of days to make, when added to the number of days passed between the day of departure from last infected place and the day of arrival at said quarantine station, a *sum total of twenty days.*

All vessels, with clean bills of health, and having had no sickness of an infectious kind *en route* from infected places so far distant from the Texas coast that twenty or more days must necessarily be consumed in the voyage, shall only be detained a sufficient length of time to enable the quarantine officer to enforce such rules and regulations as may be deemed requisite for the purification of passengers, crew, cargo, and vessel.

All vessels, from any port, arriving at quarantine station, having at time of arrival, or having had during the voyage, sickness of an infectious kind, shall be detained twenty days after death or recovery of the last case of said sickness, and longer if the inspecting officer is not satisfied that proper measures were taken immediately after the recovery or death of the *sick* to thoroughly purify the apartments occupied by destroying beds, bed clothing, wearing apparel, &c., that could possibly be converted into fomites.

In all cases where the above rules have been complied with, and there still remains a doubt in the mind of the quarantine officer as to the propriety of admitting a vessel, he shall detain said vessel, report his reasons for so doing to the governor, and subject it to daily inspection until all doubt is removed or orders received to admit it.

RULE 3. Any vessel coming from a port or place north of the twenty-fifth degree of latitude, and which has not been south of it during this season, or which has been properly disinfected after being there, and contains a cargo that has recently been brought from a port or place south of that latitude, or from an infected port north of it, which cargo has been properly disinfected, of which satisfactory information must be furnished to the health officer at any Texas port, may be admitted after thorough inspection and no suspicion of danger is entertained; but if there has been no proper disinfection of vessel and cargo when necessary, the vessel must be regarded and treated as doubtful; and passengers or crew recently from south of said latitude would give the vessel the same doubtful character. And when quarantine shall have been declared upon the land borders of the State, the same precautions must be taken in regard to all tropical productions and to passengers and employés transported in railroad cars, or steamboats, or other vessels into Texas.

RULE 4. Any contemplated modification of the above rules, that may be justified by the erection of disinfecting warehouses at Galveston or elsewhere, shall first be submitted to the governor for his action, to be granted only upon such conditions as to expense, and under such regulations as may be prescribed, so as to secure positive safety, which action shall govern all ports alike, upon similar conditions, regulations, and restrictions as nearly as may be found practicable. Said warehouse would greatly facilitate commerce by diminishing the number of days now thought necessary to embargo a vessel from an infected port, and would probably give greater security in ten days than we now have in twenty; but, with a warehouse or without one, the crew of a vessel from an infected port shall be held for ten days from the handling of, and breaking the bulk of cargo, before permitted to pass quarantine.

RULE 5. Whenever any apparatus or preparations shall be offered for disinfecting purposes they must be submitted with full description to the governor, who will inspect and pass upon them; and in all such cases perfect safety must be assured before they will be adopted, and specific instructions will be given from this office to health officers who may use them.

RULE 6. Vessels from infected ports, laden with *only* such articles as cannot possibly convey yellow fever, such as agricultural implements, machinery, iron, lumber, wagons, bacon, salt, &c., an itemized list of which will be given, may be admitted upon conditions stipulated beforehand for the admission of such vessel at any port, and proper arrangements made therefor under such directions as may be sanctioned by the governor.

RULE 7. Vessels coming empty from infected ports for shipping cattle may be admitted at any port, after complete arrangements have been made to insure positive safety under such regulations and restrictions as may be prescribed beforehand upon application therefor.

RULE 8. The boards of health, and officers acting under them, will please examine and observe the laws of this State relating to quarantine, both in the digest of civil statutes and in the general laws of the sixteenth legislature, and all civil officers and citizens are respectfully requested to aid said officers in the enforcement of the laws and regulations.

RULE 9. The respective boards and health officers should give heed to the instructions and advice of the National Board of Health and its officers, given in aid of State quarantine, not disregarding, however, the more rigid rules herein required, and made necessary by the nearness of our coast to the tropics.

RULE 10. The station at Sabine Pass will be under the control for quarantine purposes of such health officer and other agents and employés as may be appointed by the county judge and commissioners' court of Jefferson County.

The pass at Galveston to be under the control of the board of health of said city, and such health officer, agents, and employés as they may appoint for quarantine purposes.

The stations at mouths of Bernard and Brazos Rivers and San Louis Pass to be under the control of the county judge and commissioners' court of Brazoria County, and such health officer, agents, and employés as they may appoint.

The station at Aransas Pass and Corpus Christi Pass to be under the control of the authorities of Corpus Christi and such health officer, agents, and employés as they may appoint.

The station at Brazos Santiago and the mouth of the Rio Grande, so far as Texas has a right thereat, to be under the control of the city authorities of Brownsville, and such health officer, agents, and employés as they may appoint. And said authority shall also, whenever it may become necessary for quarantine purposes, make provision for guarding and assuming control of all crossings of the Rio Grande leading to said city, of which, however, notice of its necessity shall forthwith be given to the governor for his sanction or disapproval.

The municipal authorities of the city of Houston, and the board of health appointed by them, if any, to have control of that city, and such other points in Harris County as lead to it, and with authority to appoint a health officer and such employés as may be required, whenever it shall become necessary, and not before, to establish a quarantine there for the protection of that city and the country in rear of it, of which notice is requested to be given to the executive for his action thereon.

RULE 11. In anticipation of the possibility of yellow fever or other infectious disease entering the territory of the United States at some point north of the twenty-fifth degree of north latitude, the following

directions are hereby requested to be observed, so as to promptly establish a quarantine on the eastern and northern borders of the State, as soon as it may become necessary, and to be then, and not until then, put in force and practical operation.

The county commissioners' court of Orange County will take control of the station at the railroad crossing of the Sabine River, near the town of Orange, and of the crossings of said river leading to Texas, in said county, and appoint a health officer, agents, and employés therefor.

The corporate authorities of Marshall will take like control of the station at Waskum, at the crossing of the Texas and Pacific Railroad of the Texas line, and of other crossings of said line in Harrison County, and appoint a health officer, agents, and employés in like manner.

The corporate authorities of Texarkana will take control of the station at that place and at such other crossings of Red River and the State line as are in Bowie County, and appoint a health officer, agents, and employés therefor.

The corporate authorities of Denison will take control of the station where the railroad crosses Red River near that place and other crossings in Grayson County, and appoint a health officer, agents, and employés therefor; and all officers so appointed shall be ready to take action for themselves upon receiving information that yellow fever has appeared at any place within the interior of the United States: and until more specific directions are given from this office they will enforce the quarantine regulations, as nearly as practicable, against any such infected places as are herein prescribed for the stations on the coast of Texas.

RULE 12. The local authorities thus recognized as taking control of each of said stations are requested to make contracts with said officers and employés, consulting therein both efficiency and economy, and provide such things otherwise as may be deemed necessary for the service, subject to the approval of the governor, and promptly report the same to him, with names of persons, their duties, the prices agreed on, and cost of things purchased; and whenever any addition or change is required to be made, that is also to be promptly reported. They will also approve all accounts admitted to be just and forward them to the governor for his approval, specifying the nature of the service or the object for which accounts have been made.

Being invested with the great responsibility of preventing by quarantine the importation of infectious diseases into Texas, I earnestly solicit from all persons information that will give greater efficiency to the quarantine service or that may be of service to me in protecting the State from epidemics.

O. M. ROBERTS,
Governor.

By the Governor:
[L. S.] T. H. BOWMAN,
Secretary of State.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—During the week ending April 22 there were three deaths from yellow fever, all in the military hospital. Small-pox caused 42 deaths and typhoid fever 18. Of the latter disease it is estimated that at least 600 cases exist in the city; the mortality is small in proportion to the number of cases. The Norwegian bark Meteor, which sailed for New York April 23, left her captain sick in hospital with small-pox. The crew were vaccinated before sailing, and their apartments disinfected.

NEW ORLEANS, LA.—Surgeon-General J. B. Hamilton, of the United States Marine Hospital Service, forwards the following information from Assistant Surgeon S. T. Armstrong, under date of April 24:

Referring to the case of small-pox at Vicksburg, reported in No. 41 of the BULLETIN, Dr. Armstrong remarks that another case was received into the hospital at New Orleans from the same boat, the J. S. McDonald.

The eruption in this second case was said to have appeared on the 16th of April; the boat left immediately after sending the man to hospital, and there was no opportunity to ascertain her sanitary condition. The boat is now on the way to Pittsburgh, and being probably infected might distribute small-pox along the Mississippi and Ohio Rivers, as the Porter did the germs of yellow fever in 1878.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—The reports of United States Consul W. E. Goldsborough for the last two weeks of February show that no contagious disease prevails in the city.

BUENOS AYRES.—United States Consul E. L. Baker reports for the month of February 12 deaths from typoid fever and 12 from diphtheria. Total deaths, 414; population, 270,000; annual death-rate, 20.0 per 1,000.

CONSTANTINOPLE.—The letter of Dr. Matteosian, forwarded last week by United States Consul G. H. Heap, gives the following information concerning the plague in Mesopotamia, under date of March 30:

It is well known that for many years the plague has been endemic in Mesopotamia and in the province of Bagdad. Sporadic cases are rarely absent, and epidemics are not unfrequent. The question of causation is not definitely settled, but the general opinion among those who have investigated the subject inclines to the belief that the disease is due to the custom of transporting immense numbers of corpses, in all stages of decomposition, to the sacred vaults of Nedjeff and Karbella. With this view the International Sanitary Council has used all its influence to induce the Turkish and Persian governments to abolish or to modify this custom.

The telegrams up to March 30 indicate that the plague has so far been confined within the *cordon* which has been strictly maintained, but there is no relaxation of vigilance in preventing its extension.

FOOCHOW, CHINA.—United States Consul J. C. A. Wingate reports for the month of February that no epidemic disease has prevailed in the native town or foreign settlement.

FUNCHAL, MADEIRA.—United States Consul T. B. Reid forwards a report from Dr. Julius Goldschmidt, a medical practitioner of long experience in the island, giving the record of mortality and disease for the year 1880, so far as it could be ascertained.

Funchal, the capital of Madeira, is situated on the southern coast of the island, in latitude 32° 38′ N., and longitude 16° 55′ W. Population of the town, 21,000; of the suburbs, 18,000, according to the census of 1878; of the whole island, 130,473. The town is extending from east to west, at the foot of the central ridge of mountains, which rise with a steep ascent from the ocean to a height of 6,000 feet, and afford complete protection to the south side of the island from the prevailing northeast winds. The rainfall is carried off by three rivulets passing through the town and constituting its only drainage. The ground upon which the city is built has a basis of basaltic rock, covered by a thin stratum of very fertile soil. The mean temperature of the year is 66°.7; of the winter (October to June), 64°.2, and for the summer, 71°.6. The daily oscillations of the mercury are remarkably small, being only between 7° and 8° at any season; the extreme temperatures, rarely observed, have been for the minimum of the night 47° and of the day 57°. The average rainfall for the year is very variable, being between 12 and 44 inches in different years. The relative humidity is between 66 and 73 per cent. for the year. The prevailing winds are from north to east (trade winds), and the exceptions are most frequent in summer, when a hot and dry wind from the desert of Sahara, known as the *Leste*, blows from one to five days. The air near the sea contains much ozone, which almost disappears at higher altitudes. The general sanitary condition of the island, and especially of Funchal, is very satisfactory, though there is an utter absence of public or private hygienic regulations. The average death-rate for the whole island per annum does not exceed 20, or for Funchal 24.4 per 1,000. Epidemic diseases are very rare. Six years ago small-pox prevailed and there were altogether about 1,000 deaths from it, which was not surprising, as the people are generally opposed to vaccination, either through ignorance or prejudice. Scarlet fever and diphtheria appear only sporadically, and in much milder form than in other climates. Measles and whooping-cough have been occasionally observed, but are very seldom fatal. In spring and in autumn gastric and typhoid fevers often appear, chiefly among the poorer classes, who live in very crowded habitations and drink the water from the irrigating canals or *levadas*, which are polluted by the drainage from houses. Heart-diseases are frequent, as steepness of the roads prevents the general use of vehicles, and burdens are usually carried up and down the hills by men. Acute lung diseases are also observed among the people of the mountain districts, who are exposed to great changes of temperature and atmospheric influences in their daily journeys up and down the mountains. But notwithstanding the many predisposing causes of consumption to be found among the poor, even that class is not very liable to the disease in Madeira. Among the foreign residents, who live in comfort, but are mostly descended from phthisical parents, only one death from consumption has been registered in 15 years. The death-

rate among children is high in proportion to the general mortality, and the cause is to be found in the conditions attending the poverty of the people. The deaths under 5 years are largely due to diseases of the digestive or of the respiratory organs, as in other countries. But *entozoa* are remarkably frequent among the children, and the obsolete term "*febris verminosa*" often appears among the reports of causes of death. Syphilis is extremely rare in the island generally, being almost confined to the port. The system of weekly medical inspection of all known prostitutes is strictly enjoined by the law, but not fully carried out. Leprosy was supposed to have been introduced by the first settlers, and is still found in the southern and western parts of the island. The hospital for this disease usually contains from 7 to 15 patients, but it is estimated that between 400 and 500 persons on the island may be affected with leprosy.

MALTA AND GOZO.—United States Consul C. B. Eynaud reports 141 deaths for the two weeks ending March 15; population, 154,830; annual death-rate, 13.7 per 1,000. No contagious diseases reported.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer reports 465 deaths in December, of which 4 were from cholera, 7 from typhoid fever, and 12 from other contagious diseases. Population, 265,000; annual death-rate, 20.7 per 1,000; mean temperature, 62°.

MONTEVIDEO, URUGUAY.—United States Consul A. L. Russell sends three monthly reports. For November, 1880, there were 214 deaths reported; 1 from small-pox, 2 from typhoid fever, and 5 from other contagious diseases. Population, 111,500; annual death-rate, 23.4 per 1,000. For December, 274 deaths; 9 from typhoid fever and 6 from other contagious diseases; annual death-rate, 29.0 per 1,000. In January there were 302 deaths; 2 from small-pox, 5 from typhoid fever, and 3 from other contagious diseases; annual death-rate, 31.9 per 1,000.

MOSCOW, RUSSIA.—United States Consul A. Weber reports for the month of January a total of 2,214 deaths, of which 265 were from typhoid fever, 25 from small-pox, 26 from scarlet fever, and 90 from other contagious diseases. There were 542 deaths from lung diseases and 215 from diarrhœal diseases. Population, 601,969; annual death-rate, 43.3 per 1,000. Mean temperature, 10°.

NINGPO, CHINA.—United States Consul E. C. Lord reports that measles and small-pox have prevailed during February, but no estimate of cases or deaths can be made.

SAN JUAN, PORTO RICO.—United States Consul E. Conroy reports for the month of February, yellow fever, 4 cases and 1 death; small-pox, 85 cases and 11 deaths; typhoid fever, 5 cases and 1 death. Total deaths, 66; population, 23,240; annual death-rate, 37.0 per 1,000. There has been no rain for six weeks, and the sewers are filled with filth; small-pox is increasing daily.

SANTIAGO DE CUBA.—United States Consul J. C. Landreau sends a report for the month of March, showing 13 cases of yellow fever and 7 deaths; small-pox, 15 cases and 8 deaths; typhoid fever, 10 cases and 5 deaths. Total deaths, 127; population, 40,000; annual death-rate, 38.3 per 1,000. The contagious diseases being among the Spanish troops, and the harbor and vicinity being free from disease, clean bills of health are still issued.

TUXPAN, MEXICO.—Under date of April 1, Dr. A. M. Boyd reports that 17 deaths occurred during the month of March. The population being 7,186, the annual death-rate was 27.0. Among the causes noted were: Consumption, 1; pneumonia, 3; malarial fevers, 6; and accidents, 4. No epidemic or contagious disease has prevailed in the port during the month.

SANITARY LEGISLATION IN NEW JERSEY.

The following act has been passed by the legislature of New Jersey relative to adulteration of food and drugs:

AN ACT to prevent the adulteration of food or drugs.

1. *Be it enacted by the senate and general assembly of the State of New Jersey*, That no person shall, within the State of New Jersey, manufacture, have, offer for sale, or sell any article of food or drugs which is adulterated, within the meaning of this act, and any person violating this provision shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding $50 for a first offense, and $100 for a second and subsequent offenses.

2. *And be it enacted*, That the term "food," as used in this act, shall include every article used for food or drink by man, and that the term "drug," as used in this act, shall include all medicines for internal or external use.

3. *And be it enacted*, That any article shall be deemed to be adulterated within the meaning of this act:

(*a*)—IN THE CASE OF DRUGS.

First. If when sold under or by a name recognized in the United States pharmacopœia, it differs from the standard of strength, quality, or purity laid down therein;

Second. If when sold under or by a name not recognized in the United States pharmacopœia, but which is found in some other pharmacopœia, or other standard work on materia medica, it differs materially from the standard of strength, quality, or purity laid down in such work;

Third. If its strength or purity fall below the professed standard under which it is sold;

(*b*)—IN THE CASE OF FOOD OR DRINK.

First. If any substance or substances has or have been mixed with it, so as to reduce or lower, or injuriously affect its quality or strength;

Second. If any inferior or cheaper substance or substances have been substituted wholly or in part for the article;

Third. If any valuable constituent of the article has been wholly or in part abstracted;

Fourth. If it be an imitation of or be sold under the name of another article;

Fifth. If it consist wholly or in part of a diseased or decomposed or putrid or rotten animal or vegetable substance, whether manufactured or not; or in the case of milk, if it is the produce of a diseased animal;

Sixth. If it be colored, or coated, or polished, or powdered, whereby damage is concealed, or it is made to appear better than it really is, or of greater value;

Seventh. If it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of a person consuming it; provided, that the State board of health may, with the approval of the governor, from time to time declare certain articles or preparations to be exempt from the provisions of this act; and provided further, that the provisions of this act shall not apply to mixtures or compounds recognized as ordinary articles of food; provided that the same are not injurious to health, and that the articles are distinctly labeled as a mixture.

4. *And be it enacted*, That the State board of health shall, from time to time, fix the limits of variability permissible in any article of food or drug or compound, the standard of which is not established by any national pharmacopœia.

5. *And be it enacted*, That the State board of health shall take cognizance of the interests of the public health, as it relates to the sale of food and drugs and the adulteration of the same, and make all necessary investigations and inquiries relating thereto; it shall also have the supervision of the appointment of public analysts and chemists, and upon its recommendation, whenever it shall deem any such officers incompetent, the appointment of any and every such officer shall be revoked, and be held to be void and of no effect. Within thirty days after the passage of this act the State board of health shall meet and adopt such measures as shall seem necessary to facilitate the enforcement of this act, and prepare rules and regulations with regard to the proper methods of collecting and examining articles of food or drugs, and for the appointment of the necessary inspectors and analysts; and the said board shall be authorized to expend, in addition to all sums already appropriated for said board, an amount not exceeding $500 for the purpose of carrying out the provisions of this act.

6. *And be it enacted*, That every person selling or offering or exposing any article of food or drugs for sale, or delivering any article to purchasers, shall be bound to serve or supply any inspector appointed under this act, who shall apply to him for that purpose, and on his tendering the value of the same for a sample sufficient for the purpose of analysis of any article which is included in this act and which is in the possession of the person selling, under a penalty not exceeding $50 for a first offense, and $100 for a second and subsequent offense.

7. *And be it enacted*, That any violation of the provisions of this act shall be treated and punished as a misdemeanor, and whoever shall impede, obstruct, hinder, or otherwise prevent any analyst, inspector, or prosecuting officer in the performance of his duty, shall be guilty of a misdemeanor, and shall be liable to indictment and punishment therefor.

8. *And be it enacted*, That any acts or parts of acts inconsistent with the provisions of this act are hereby repealed.

9. *And be it enacted*, That this act shall be deemed a public act, and shall take effect at the expiration of thirty days after it shall become a law.

Approved March 25, 1881.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING APRIL 23, 1881.

SANITARY INSPECTION AT PORTS ON THE GULF OF MEXICO.

The following letters relate to the quarantine regulations of the ports on the Gulf of Mexico, as regards the action of local boards of health and of the agents of the National Board:

OFFICE OF THE BOARD OF HEALTH,
PORT OF MOBILE, ALA.,
April 19, 1881.

DEAR DOCTOR: I am directed by our board of health to make inquiry of you if it is the purpose of the National Board of Health to obligate all vessels coming from infected or suspected places to report at Ship Island for inspection, &c., before entering any of the Gulf ports. If, out of regard for the jealousies of State and municipal authorities, your Board will not make such exactions, except upon the request of the local boards, I am directed to state that it is the desire of this board that all vessels coming from places of the character above mentioned shall first report to your quarantine station, and, if necessary, there undergo the detention, fumigation, &c., required in the case before entering our bay. If such meets with the approval of the National Board, and we think it is in harmony with the plans proposed for the protection of our coast, we will so inform the consignees of vessels, that they may issue such instructions as will carry out the object to be attained.

We will await your reply before addressing those gentlemen.

Very truly,

E. H. FOURNIER, M. D.,
Health Officer.

T. S. SCALES, M. D.

NATIONAL BOARD OF HEALTH,
SHIP ISLAND QUARANTINE STATION,
April 20, 1881.

SIR: I have to acknowledge the receipt of your communication of the 19th instant, and in reply would state that, in my opinion, if the National Board of Health receives the cordial support of State and local boards of health, a national law will eventually pass *requiring* all vessels from infected and suspected ports within prescribed periods of time to call at this or similar stations for inspection, detention, or purification before being allowed to proceed to port of destination, but at the present time the National Board of Health has not the authority to enforce such requirement.

It appears to me that it is for your honorable board to pass a resolution requiring vessels bound for Mobile from infected or suspected ports—say between the 1st of June and the 1st of November—to call at this station and procure my permit before being allowed to come to your city, and you have accomplished the desired object. Of course it would be necessary to have the resolution published, and to instruct your quarantine physician, harbor-master, and port wardens accordingly. I should like very much to have sent me a printed copy of such resolution if passed.

You know the object of the National Board is to *aid* and *assist* State and municipal boards, but I do not think the authority has ever been vested in said board to enforce the requirements herein alluded to, though I should be pleased if your board would pass the resolution in question, and send us any dangerous shipping that might threaten your sanitary interest; should also be pleased to receive delegates from your body and have them examine the facilities at this station for dealing with such shipping. I hope that I have made myself understood as to the point in question, viz: That, in my opinion, State and municipal boards or authorities have the power to pass resolutions making it a *sine qua non* for vessels from infected and suspected ports, within prescribed periods of time to enter their ports, that they shall first call at this or similar stations and secure the official permits of the officer in charge.

You will observe that I have given you my individual opinion only in relation to the matter, but I shall at once forward to Washington your letter and a copy of this reply.

Most respectfully,

T. S. SCALES, M. D.,
Superintendent.

To Dr. E. H. FOURNIER,
Health Officer, Mobile, Ala.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

The following reports, for the week ending April 23, 1881, are from places where burial permits are not required:

Allegheny, Pa., 78,681; deaths, 31; under 5 years, 13; cerebro-spinal meningitis 2, consumption 5, diphtheria 1, scarlet fever 5, pneumonia 1, puerperal 1. NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MAY 14, 1881. [No. 46.

REPORT OF A COMMITTEE OF THE SANITARY COUNCIL OF THE MISSISSIPPI VALLEY.

SANITARY COUNCIL, MISSISSIPPI VALLEY,
Office of the Secretary, April 23, 1881.

SIR: In pursuance of instructions, I herewith forward you copies of reports of committees as adopted by the Sanitary Council of the Mississippi Valley at its recent meeting in the city of Evansville, Ind., April 20–21, with the request of the council that the same be published in the BULLETIN of the National Board of Health, at an early date, for the prompt information of health organizations throughout the country.

Copies of the addresses delivered at the meeting will also be forwarded you as soon as the corrected manuscripts are received from the various authors. It is desired that, if within the scope of the BULLETIN, these also be published in a future number.

Very respectfully,

JOHN H. RAUCH, M. D.,
Secretary of the Council.

DR. T. J. TURNER, U. S. N.,
Secretary National Board of Health, Washington, D. C.

Report of a committee of the Sanitary Council of the Mississippi Valley on certain topics of the project of business submitted for the action of the council by the president, R. C. Kedzie, M. D., of Lansing, Mich.

MR. PRESIDENT: Your committee, to which was referred sundry subjects for discussion and formulation, and which subjects are hereinafter recited, begs leave to report that it has had the various propositions under consideration, and now offers for the action of the council the following resolutions, as embodying the views of the committee:

First. Representatives of the National Board to reside at quarantine station on the Mississippi River. Also, a representative to reside at New Orleans, with the privilege of access to the records of the State board of health, and to attend their meetings.

Resolved, That the Sanitary Council of the Mississippi Valley reaffirms the action had at its December, 1880, meeting in New Orleans; demands that the Louisiana State board of health invite the appointment and maintenance by the National board of health of inspectors at New Orleans, at Eadsport, and at the Mississippi quarantine station; and announces that in the event of any failure on the part of the said State board of health of Louisiana to act in good faith toward said inspectors then the boards of health represented in this council will be compelled to take into their own hands the protection of the health of their own people.

Second. Arrangement of the work of inspectors of railroads and steamboats, the inspection at the month of the river, and ordering infected vessels to Ship Island.

Resolved, That the inspection service of river and rail transportation by the National Board of Health is hereby indorsed, and its reestablishment for the ensuing season is urged, with the compact on behalf of the representatives in this council that the certificates and bills of health issued by said inspection service shall be accepted as *prima facie* evidence of the sanitary status of vessels and trains presenting the same.

Resolved, That this council, being firmly convinced that the safety of New Orleans, as well as of the valley, lies in the rigid exclusion of infected ships from the Lower Mississippi, strenuously urges upon the State board of health of Louisiana the modification of section 6 of its "rules and regulations for the government of quarantine officers and stations," etc., so as to read:

SEC. 6. All vessels from ports in which yellow fever is prevailing, or from ports where other contagious or infectious diseases are reported to exist, shall be inspected at Eadsport, and if any such be found to be infected or to furnish reasonable ground for suspicion of infection, such vessel shall not be allowed to pass Eadsport northwise, except upon presentation of a certificate from the inspector of the National Board of Health at the Ship Island quarantine station, setting forth that the vessel has been subjected to proper treatment and is free from liability of conveying contagion.

Resolved, That, in the judgment of this council, the quarantine of vessels and freight should consist of purification of the vessel and its contents, which should then be returned to commerce as speedily as practicable, and that any arbitrary detention beyond the time necessary for such purification is not only unnecessary, but positively increases the danger of propagating and spreading infection.

Third. The means of informing the board of health in the valley of apprehended danger.

Resolved, That this council condemns all methods of suppression and secrecy with reference to information of contagious or infectious diseases, and therefore discountenances the use of cypher telegrams; but in the event of danger from such diseases at any point in the Mississippi Valley, it is the duty of the executive officer of the health organization of such place to fully and promptly advise the proper authorities at all threatened points.

In addition to the foregoing your committee respectfully submits that it is now a well settled opinion of sanitary authorities that quarantine for yellow fever, especially in latitudes subject to the epidemic prevalence of that disease, *should never be located on the mainland*. The peculiar manner of extension of that pestilence over contiguous territory renders an insular position of hospitals in which the sick are treated and buildings to which infected cargoes are removed absolutely essential to secure perfect safety to surrounding communities. States and municipalities which have organized their quarantine establishments by removing them from the mainland to uninhabited islands have had the happiest results. It was to secure this great and practicable reform in the management of the Mississippi quarantine that certain propositions were made to the State board of health of Louisiana.

Although in the quarantine system of the Lower Mississippi it is so manifest as to scarcely require argument, yet it is due the council that we should briefly discuss the following propositions:

1. *The present quarantine establishment is wholly unfit for the reception of yellow fever patients, for the detention of persons exposed to yellow fever, or for the care of infected cargoes.*

A. For the care of yellow fever patients we hold that the hospital must be located on an island in order to give the greatest security against the spread of yellow fever. It is no sufficient argument to allege that yellow fever has never yet spread from the hospital at the Mississippi quarantine. The proofs of the allegation are by no means convincing, as there are many circumstances vitiating that conclusion. But even if it were true, the movements of the population on the Lower Mississippi are rapidly changing the neighborhood of the quarantine. One of these settlements is within a few hundred yards of the station. A large population of negroes is accumulating on the banks of the Lower Mississippi, whose habits of living render the reception and propagation of yellow fever a matter of the greatest certainty.

B. The detention of the well who have been exposed to yellow fever at the Mississippi quarantine should no longer be allowed. It is located on the banks of the Mississippi, is but a few feet above the level of the Gulf of Mexico, and is protected from the overflow of the river by levees. According to the report of Dr. Joseph Jones, the inhabitants of this region are annually liable to visitations of the malignant malarial and hemorrhagic fevers of the alluvial regions in tropical, semi-tropical, and temperate countries, and these fevers are becoming more and more violent annually, owing to the rapid increase of the acreage of rice-culture. The fear of being confined in the buildings on the quarantine grounds, owing to the danger of contracting malarial fever, is often expressed by seamen familiar with the history of those subjected to detention.

C. The same objection to the lightering of infected cargoes and their storage in warehouses applies as to the care of yellow fever patients on the mainland. Such transfer of cargoes and their subsequent disinfection must be undertaken at island warehouses if we would secure the greatest possible immunity from the spread of infection.

2. *A quarantine establishment is now provided at Ship Island, having a convenient location on an uninhabited island, and fully furnished with every necessary convenience and appliance for the treatment of yellow fever patients, for the care and comfort of persons exposed to infection, the disinfection and storage of disinfected cargoes, and immediate and thorough cleansing and purification of ships.*

Unsuitable as the Mississippi quarantine is for the protection of the valley against the importation of yellow fever infection, there has been no method of supplementing its defects until the Ship Island quarantine was established by the general government. This quar-

antine fully meets all of the requirements which science and skill demand to render the Gulf coast defenses against the introduction of yellow fever complete. From the publications of the National Board of Health we learn the following facts in regard to this quarantine: Ship Island was selected for a government quarantine because: 1st. "it belonged to the United States Government." 2d. It was uninhabited. 3d. Its conformation permitted the location of the several departments so as to secure complete isolation of each from the other. 4th. It afforded safe anchorage. 5th. It was convenient to the largest extent of quarantine coast, viz, from Pensacola to the mouth of the Mississippi. 6th. The objects sought to be accomplished by this quarantine were simply co-operative with the local quarantine of the adjacent coast.

It does not supersede existing local quarantine except as far as it provides for all the desideratum of the quarantines of that region, an insular location where vessels infected with yellow fever with their passengers, crews, and cargoes can be safely, promptly, and adequately cared for with the least possible danger of spreading the disease.

This establishment is now fully equipped with every necessary appliance to give proper care and treatment to the sick of yellow fever, to isolate with every needful comfort those detained for observation, adequate warehouses for the storage of infected cargoes, and every necessary means for the thorough purification of ships.

3. *It is alleged against this quarantine: (a) that it does not prevent the passage of infected vessels into the harbors of the coast; (b) that it is too distant from important points, as the mouth of the Mississippi; (c) that if recognized and made part of the quarantine system of the Gulf coast it would seriously obstruct commerce.*

a. The Ship Island quarantine is not a station for the interception of passing vessels, but is designated solely to care for infected ships. The duty of intercepting vessels properly belongs to the local quarantines, and if vigilantly performed by them no infected ship, baggage, or cargo would hereafter ever reach the mainland of that coast.

b. The distance of Ship Island from the months of the Mississippi is no valid argument against sending infected ships to that quarantine, in view of the absence of all suitable provisions for treating them at the Mississippi quarantine, and of the imminent danger which follows their passage up the river to that station. We must insist that a ship infected with yellow fever is contraband of quarantine, and must be completely relieved of its disability before it is allowed again to enter the ports of the Gulf. Half-way measures of purification should no longer be tolerated.

c. The statement that if infected vessels bound to New Orleans must first go to Ship Island for cleansing and disinfection the commerce of that city would be injured, cannot be sustained by any facts. It appears from the report of Dr. Joseph Jones, president of the State board of health of Louisiana, that 1,271 vessels passed the Mississippi station in 1880; of these but 151 were detained for purification, disinfection, and fumigation, and of these latter but one proved to be an infected vessel. It follows that if the quarantine officer had sent all infected vessels arriving at the Mississippi station during the year 1880, but one vessel out of 1,271 would have had that destination. It is absurd, therefore, to presume that if the health authorities of the State of Louisiana were to regard the Ship Island quarantine as the proper destination of infected vessels bound for New Orleans, the foreign commerce of that city would be impaired. On the contrary, facts prove that the passage of that one vessel to the wharves of New Orleans proved a source of imminent danger to all of its inland traffic.

In conclusion, your committee desires to express the firm conviction that the Ship Island quarantine meets a want of the local quarantines of that part of the Gulf coast which cannot be superseded by any amount of vigilance, nor by any stringency of rules of such quarantines.

We believe, therefore, that this council should adopt, and as far as possible secure the enforcement of, the proposition that an officer should be stationed at Port Eads who shall be required to send all vessels infected with yellow fever to the Ship Island quarantine.

In the same connection we would add that it is important that all of the local quarantines from Mobile to the months of the Mississippi be requested to send vessels infected with yellow fever to that quarantine for treatment.

In order to secure the protection which the council seeks, it is evident from the attitude of some of the officers of the local quarantines of that section of the coast that co-operation in this plan can be secured only by the intervention of some central authority which can harmonize conflicting opinions and interests. This authority is found in the President of the United States, and it is the opinion of your committee, formed after mature deliberation, that under the circumstances adequate protection against the importation of yellow fever into the Mississippi Valley during the approaching season cannot be assured except by an appeal to the President to exercise jurisdiction over the quarantines of the coast. To this end your committee submits for the consideration of the council the following resolutions:

Resolved, 1. That there is good reason to believe that the infection which causes yellow fever has been exterminated from the soil of the United States by the extreme cold of the past winter, and that any future outbreak of that pestilence in this country must be due to a fresh importation from foreign countries of the infected matter which causes the disease.

2. That it is therefore of the greatest importance to the business interests of the country, and to the health and happiness of the people, especially of those living in districts liable to be visited by this scourge, that every avenue through which it may reach our shores be effectually guarded.

3. That as yellow fever can reach this country from foreign ports only through our own seaports, the necessity of quarantine establishments on the South Atlantic and Gulf coasts, so organized and administered as to be most effective against the introduction of yellow fever and least obstructive to commerce and travel, is an imperative necessity.

4. That as representatives of the public health interests of the States of the Mississippi Valley, we especially recognize the importance of a more thorough and effective organization and administration of the quarantines of the Gulf coast, and particularly of that at the mouth of the Mississippi River, the great water-way of commerce and travel for the people of the valley.

5. That the experience of the past teaches that the quarantines of that coast, and especially that on the Lower Mississippi, cannot be relied on to prevent the introduction of yellow fever into the valley of the Mississippi, and that therefore immediate measures should be taken to so improve their management that all the resources of science and of human skill shall be applied to prevent another invasion of yellow fever through that channel.

6. That considering the vast social, commercial, and industrial interests involved in the prevention of the introduction of yellow fever at the mouth of the Mississippi River this season, the management of that quarantine is a matter of grave national concern, and should lead to such action of the general government as will give the greatest effectiveness to its administration.

7. That, with a view to accomplish the objects set forth in the preceding resolutions most speedily and directly, the President of the United States be, and is hereby, respectfully but earnestly requested to ascertain at the earliest practical moment whether any, and, if so, what additional rules and regulations are required to render the quarantines of the Gulf coast, and especially that at the mouth of the Mississippi River, effective in preventing the introduction of yellow fever into the United States, and if additional rules and regulations are required that they be immediately made and duly enforced during the approaching quarantine season.

8. That a committee consisting of one member from each State represented in this association be appointed, of which the president shall be the chairman and the secretary shall be the secretary, to lay these resolutions before the President of the United States and to urge immediate action thereon.

All of which is respectfully submitted.

T. G. BIRCHETT, *of Mississippi.*
GUSTAVE DEVRON, *of Louisiana.*
D. H. DUNCAN, *of Arkansas.*
G. W. FOOTE, *of Illinois.*
D. B. HILLIS, *of Iowa.*
H. G. JONES, *of Indiana.*
R. C. KEDZIE, *of Michigan.*
A. J. MILES, *of Ohio.*
J. J. SPEED, *of Kentucky.*
J. M. TARBELL, *of Florida.*
J. D. PLUNKET, *of Tennessee, Chairman.*

The report as read was accepted, and the resolutions were unanimously adopted by the council. In obedience to the eighth resolution, the following members were appointed a committee to lay the report and the resolutions before the President of the United States, and to urge immediate action thereon.

F. R. MICHEL, *of Alabama.*
A. L. BREYSACHER, *of Arkansas.*
S. C. COBB, *of Florida.*
J. H. RAUCH, *of Illinois, Secretary of the Committee.*
THAD. W. STEVENS, *of Indiana.*
W. S. ROBERTSON, *of Iowa.*
PINKNEY THOMPSON, *of Kentucky.*
C. B. WHITE, *of Louisiana.*
R. C. KEDZIE, *of Michigan.*
D. W. HAND, *of Minnesota.*
WIRT JOHNSTON, *of Mississippi.*
J. SPIEGELHALTER, *of Missouri.*
A. J. MILES, *of Ohio.*
J. D PLUNKET, *of Tennessee.*
D. S. SWEARINGEN, *of Texas.*
O. W. WIGHT, *of Wisconsin.*
J. J. SPEED, *President of the Council, Chairman of the Committee.*

Report of a committee of the sanitary council on methods of securing harmony and concert of action by State and municipal health organizations in the Mississippi Valley.

Whereas experience has shown that no uniformity or concert of action can be secured by the arbitrary regulations of municipal

boards of health in arresting the spread of yellow fever: therefore, be it—

Resolved, That it is the sense of this council that the adoption by State and municipal health organizations of this valley of the rules and regulations of the National Board of Health as published, furnishes a practical basis for harmonious action if yellow fever or other infections or contagious disease prevail at any point tending to spread.

GUSTAVE DEVRON,
Chairman, on behalf of the Committee.

The report was accepted and the preamble and resolution were unanimously adopted.

The following resolutions were also offered and unanimously adopted by the council:

By Dr. J. H. Rauch: *Resolved*, That the representatives from Memphis, Vicksburg, and New Orleans be invited to state to the council what has been done during the past year in their respective cities in the way of sanitary work; and in the case of Memphis, to what extent the recommendations of the National Board of Health for the sanitary regeneration of that city have been carried out.

The verbal statement concerning Memphis not being considered satisfactory by the council, a supplementary resolution was adopted, to wit:

By Dr. Pinkney Thompson: *Resolved*, That the secretary be instructed to address a letter to the president of the taxing district and the president of the board of health of Memphis asking for a statement in detail of the sanitary work actually performed since the close of the epidemic in 1879, and the extent to which the recommendations of the committee of the National Board of Health in regard to the sanitary regeneration of Memphis have been carried out—the secretary to furnish the correspondence to the press for publication.

By Dr. J. J. Speed: *Resolved*, That the sanitary council of the Mississippi Valley indorses and approves the action of the boards of health of the States of Mississippi and Tennessee, and of the cities of Vicksburg and Memphis, in the recent enactment of health ordinances and regulations for the ensuing year.

By Dr. Plunket: That the secretary of the sanitary council be, and he is hereby, instructed to furnish the reports of the committees which have been adopted at this session to the secretary of the National Board of Health with a request that said reports be published in the BULLETIN of said board, for the prompt information of the various health organization of the country.

By Dr. H. G. Jones: *Resolved*, That the health organizations, State and municipal, represented in the Sanitary Council of the Mississippi Valley be, and are hereby, requested to use their influence with the members of Congress of their respective districts to secure adequate appropriations of money for the use of the National Board of Health, to the end that said board may be enabled to carry out the measures it has already inaugurated for the protection of the public health and the consequent advancement of the material prosperity of this region.

—

A meeting of the committee appointed by the quarantine convention, in the city of New Orleans, December 7–10, 1880, was held in Evansville, Ind., April 21, 1881, and the following resolution unanimously adopted:

Resolved, That it is the sense of this committee that the quarantine regulations formulated by the Sanitary Council of the Mississippi Valley, and subsequently revised, adopted, and published by the National Board of Health, are ample and cover the ground entirely for all present needs in the Ohio and Mississippi valleys.

—

ILLINOIS STATE BOARD OF HEALTH,
Springfield, May 3, 1881.

At a meeting of the Illinois State board of health held on April 29, 1881, the following resolutions offered by Dr. Haskell were unanimously adopted:

Resolved, That the State board of health of Illinois regard it as absolutely essential to the protection of the Valley of the Mississippi from the incursion of epidemic visitations of yellow fever, that there should be cordial co-operation between the National and the State health authorities of the Valley States, and that, to this end, we regard it as vitally important that the State boards of health in the Mississippi Valley should invite the National Board to place its inspectors at such points within their jurisdiction as, in the judgment of the National Board, the sanitary interests of the public may require, and that these inspectors should be encouraged by the various State health authorities to make the most thorough investigation of all matters affecting the public health.

Resolved, That a copy of the above resolution be forwarded to the president of the National Board of Health and the presidents of the State boards of health of the Mississippi Valley.

JOHN H. RAUCH, *Secretary.*

SANITARY LEGISLATION IN WISCONSIN.

APPLETON, WIS.—Dr. E. L. Griffin, under date of May 4, forwards a copy of the following act of legislature of that State relating to contagious diseases:

The State board of health desires to call attention to the following important law, and requests all public health officers, physicians, and agents of transportation companies to extend a knowledge of its provisions, and to aid in its enforcement:

[An act to prevent the spread of contagious, infectious, and pestilential diseases.]

The people of the State of Wisconsin, represented in Senate and Assembly, do enact as follows:

SECTION 1. Any person who shall bring, knowingly aid in bringing or cause to be brought, by railroad, steamboat, sailing vessel, stage-coach, or other public or private conveyance, into any town, village, or city of the State of Wisconsin, the body of a deceased person, unless such dead body is accompanied by the written or printed certificate of a physician or coroner, clearly stating the cause of death, and unless, when the cause of death is small-pox, diphtheria, scarlet fever, or other dangerous, contagious, infectious, or pestilential disease, such dead body is also accompanied by the written or printed permit of a lawfully-constituted public-health authority, and by the sworn declaration of an undertaker in writing, that the body of the person deceased as aforesaid is hermetically inclosed in an air-tight metallic coffin, or is encased with an abundance of powerful disinfectants according to the written or printed directions of said public-health authority, so as to render the same entirely innocuous, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not less than fifty dollars, nor more than three hundred dollars, or by imprisonment in the county jail not less than twenty days, nor more than one hundred days.

SEC. 2. Agents and employés of incorporated transportation companies, and public or private carriers of whatsoever name or nature, shall not receive for transportation, nor transport, the dead body of any person, except on receipt of duly executed papers, showing that the conditions required by section 1 of this act have been complied with under the same penalties as therein provided.

SEC. 3. Any physician, or any person assuming to act as a physician, who shall issue a false certificate whereby a case of small-pox, diphtheria, scarlet fever, or other dangerous, contagious, infectious, or pestilential disease may be concealed, shall be deemed guilty of a misdemeanor, and shall, on conviction thereof, be punished by a fine of not less than fifty dollars, nor more than three hundred dollars, and by imprisonment in the county jail not less than twenty days, nor more than one hundred days; and the ignorance of an uneducated practitioner of medicine shall not be pleaded in justification or extenuation of his offense.

SEC. 4. Any person knowingly laboring under small-pox, diphtheria, scarlet fever, or other dangerous contagious, infectious, or pestilential disease, who shall willfully enter a public place or a public conveyance, or shall in any way willfully subject others to danger of contracting his disease, or any person who shall knowingly and willfully take, aid in taking, or cause to be taken, a child or other irresponsible person, while laboring under any of the aforesaid diseases, into a public place or public conveyance, or shall in any way knowingly and willfully subject others to danger of contracting any of the aforesaid diseases from such child or irresponsible person, or any person who shall knowingly and willfully subject others to danger of contracting any of the aforesaid diseases from the body of a person deceased thereof, or any person who shall in any way knowingly and willfully expose, aid in exposing, or cause to be exposed, a child or other irresponsible person to danger of contracting any of the aforesaid diseases, shall be deemed guilty of a misdemeanor, and shall be subject to the same penalties as are provided in section 1 of this act.

SEC. 5. Upon complaint, made in writing, under oath, before any magistrate or justice of the peace, charging the commission of an offense against the provisions of this act in his county, it shall be the duty of the district attorney to prosecute the offender.

SEC. 6. This act shall take effect from and after its passage and publication, and all acts and parts of acts conflicting with the provisions of this act, in so far as they contravene the same, are hereby repealed.

Approved March 23, 1881.
Published March 26, 1881.

MISSISSIPPI CITY, *May 3*, 1881.—The following resolution was passed by the board of health of Harrison County, Mississippi, at their meeting of May 2, 1881:

Resolved, by the board of health for Harrison County, Mississippi That on and after the 15th day of May, 1881, all vessels arriving at the ports of said county, from infected ports, shall be subject to a quarantine of ten (10) days or more, at the discretion of the health officer; said quarantine to continue until otherwise ordered.

A true copy from the minutes.

F. S. HEWES, *Secretary.*

ABSTRACTS FROM CONSULAR REPORTS.

ASPINWALL.—United States Consul J. Thorington states, under date of April 22, that the report of small-pox at that port is incorrect, and no contagious disease is known to exist. In October there was one case of small-pox, but no other cases occurred and the health of the town has continued good.

BASLE, SWITZERLAND.—United States Consul F. H. Mason, in his report of mortality for the four weeks ending April 19, observes that "the usual epidemic of typhus prevails, there being at times about 160 cases at one time in the city during the month. A curious feature of the disease this year is, that it is most prevalent in the newest and wealthiest portion of the city where the houses are provided with underground drainage and all modern luxuries."

In the table the following causes of death are noted: Consumption 22, other lung diseases 11, croup 6, typhus fever 23, scarlet fever 1, whooping-cough 1. Annual death-rate about 31 per 1,000.

BEIRUT.—Under date of March 26 United States Consul J. T. Edgar reports that the plague has broken out in the southeastern part of Asiatic Turkey, in the province of Irak Arabi, south of Bagdad. Strict quarantine measures have been established by the Turkish officials to isolate the disease as far as possible. Numerous quarantine stations have been established by the governors of Aleppo and Damascus in the direction of Bagdad.

CONSTANTINOPLE.—Under date of April 10, the following communication is sent by Aristarchi Bey, minister to the United States from Turkey:

Several of the Constantinople newspapers, on pretended private information, have published alarming reports regarding the plague in Mesopotamia. It is true that the epidemic has made great havoc in proportion to the population of the infected district, but it has not extended beyond the *cordon* organized to restrict it. The quarantine measures enforced in other and remote parts of the country have been only to afford protection to Syria, and to avoid damage to commerce on the Red Sea and the Mediterranean. The loss from such damage was very great during the time of the plague at Astrakan. It is to be hoped that such injury to commerce will not be wrought by exaggerated publications and unfounded reports.

CONSTANTINOPLE.—United States Consul G. H. Heap, under date of April 12, calls the attention of the Government of the United States to the continued prevalence and extension of the plague, in the region about the lower Euphrates. This disease is spreading, in spite of the vigorous measures adopted to confine it, because the nomadic tribes, among whom it appears, immediately disperse in a panic, and no military *cordon*, however strict, can prevent them from escaping through the lines. The point of interest to the United States is the danger of infected articles being received from the districts mentioned in former dispatches. Shawls, rugs, and carpets coming from that region are usually packed in close bales, and not opened till they reach their port of destination in Europe or America. Such articles are frequently those which have been in use by families in which a death from contagious disease has occurred, and induced a sale of effects regarded as dangerous. Italy, Russia and Egypt have taken measures to guard against infection from this source. The telegrams indicate continued vigilance on the part of the sanitary authorities and their agents under the Turkish Government.

FOOCHOW, CHINA.—United States Consul J. C. A. Wingate reports that up to March 5 no epidemic or contagious disease was known to exist in the city.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett forwards a report for the first three months of 1881. There were 41 cases of yellow fever treated during this time at the military hospital, of which 22 proved fatal; in the town of Pointe à Pitre there were 10 cases and 4 deaths. The hospital cases were all from the shipping. Of the cases in the town, three only were citizens, six were masters of vessels in port, and one was an officer who contracted the disease in Martinique. It is observed that the masters of vessels, who spend most of their time on shore while in port, are less liable to contract the fever than the sailors, who are more confined to the shipping and its vicinity.

GUAYMAS, MEXICO.—United States Consul A. Willard reports for the month of March a total of 10 deaths, in a population of 5,500; annual death-rate, 21.8 per 1,000. No contagious diseases are reported.

PORTO RICO, WEST INDIES.—United States Commercial Agent Edward E. White, under date of April 21, states that small-pox has prevailed in the town of Ponce since August of last year. From August 6, 1880, to April 12, 1881, there have been 532 deaths reported officially. In August, only 10, but increasing to a maximum of 94 in December, and falling to 64 in March. During the first 12 days of April there were 14 deaths, indicating a decline in the epidemic. The deaths reported were among a population estimated at 15,000, and therefore show an extensive prevalence of the disease; the number of cases could not be ascertained. As illustrating the value of vaccination, it is noted that among the Spanish soldiers, who are compelled to use that means of prevention, no death is reported, and no case is known to have occurred.

SHANGHAI, CHINA.—Reports to March 22 state that the general health of this city continues good; only one case of typhoid fever is noted in the report, and two cases of small-pox among sailors had lately occurred.

SINGAPORE.—United States Consul A. G. Studer reports his district free from epidemic diseases up to March 28, and forwards a report of mortality for the month of February. The following causes of death are noted: From consumption 42, other lung diseases 17, diarrhœal diseases 30, "fever" 48, small-pox 1, leprosy 17.

VALPARAISO, CHILI.—United States Consul L. H. Foote, in his report for the month of February, gives a total of 454 deaths, in a population of 101,088. This would give an annual death-rate of 59.0 per 1,000; but 63 deaths being due to wounds received in the war, this number should be deducted and the rate reduced to 49.3. Consumption caused 40 deaths, fevers 164, acute lung diseases 53, and small-pox 8.

The following reports, for the week ending April 30, 1881, are from places where burial permits are not required:

Allegheny, Pa., 79,000; deaths, 20; under 5 years, 11; accident 1, cerebro-spinal meningitis 3, diarrhœa 1, diphtheria 2, bronchitis 1, small-pox 1, whooping-cough 1. Bath, Me., 8,000; deaths, 5; consumption 1. Belfast, Me., 5,308; deaths, 1. Brattleborough, Vt., 6,000; deaths, 2; under 5 years, 2; croup 1. Bucyrus, Ohio, 3,950; deaths, 4; under 5 years, 2; cerebro-spinal meningitis 1, whooping cough 2. Calais, Me., 6,172; deaths, 1. Carrollton, Miss., 600; deaths, 1; bronchitis 1. Chillicothe, Ohio, 11,000; deaths, 2; under 5 years, 1; cerebro-spinal meningitis 1. Circleville, Ohio, 5,996; deaths, 7; cerebro-spinal fever 5, pneumonia 1. Coldwater, Mich., 4,800; deaths, 4; consumption 1, pneumonia 2. Columbus, Ga., 10,000; deaths, 4; under 5 years, 2; accident 1, consumption 1. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 955; no deaths. Dallas, Tex., 10,327; deaths, 5; under 5 years, 2; diarrhœa 1, pneumonia 2, accident 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Greenville, S. C., 6,500; deaths, 1. Hernando, Miss., 1,000; deaths, 11; under 5 years, 1; diarrhœa 1, malarial fever 1, pneumonia 2, congestion of lungs 1, bronchitis 1, pleurisy 1, measles 3. Huntingdon, Pa., 4,500; deaths, 6; under 5 years, 2; consumption 1. Huntingdon, Tenn., 1,200; deaths, 1; pneumonia, 1. Indianola, Tex., 900; deaths, 1. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; deaths, 1; under 5 years, 1. Kenosha, Wis., 5,500; deaths, 1; consumption 1. La Salle, Ill., 8,885; deaths, 5; under 5 years, 1; consumption 1, diphtheria 1. Louisiana, Mo., 5,000; no deaths. Madison, Ind., 8,945; deaths, 7; under 5 years, 3, consumption 1, malarial fever 1. Martinsburg, W. Va., 6,334; deaths, 1. Meridian, Miss., 4,013; deaths, 2. Milan, Tenn., 1,800; no deaths. Milledgeville, Ga., 3,000; deaths, 1; puerperal 1. Muskegon, Mich., 11,300; deaths, 3; under 5 years, 1; pneumonia 1, puerperal 2. Niles, Mich., 4,200; deaths, 1. Ocala, Fla., 1,000; deaths, 1; measles 1. Painesville, Ohio, 5,504; deaths, 2; consumption 1, pleurisy 1. Pass Christian, Miss., 2,000; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; no deaths. Senatobia, Miss., 935; deaths, 1; under 5 years, 1; pneumonia 1. Springfield, Ohio, 21,000; deaths, 9; croup 1, pneumonia 1, measles 1. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; deaths, 1; under 5 years, 1; accident 1. Tuscaloosa, Ala., 2,000; deaths, 1. Verona, Miss., 1,000; no deaths. Winchester, Va., 5,000; deaths, 4; under 5 years, 3; scarlet fever 2, bronchitis 2. Youngstown, Ohio, 15,421; deaths, 2; accident 3, cerebro-spinal meningitis 1, consumption 2. Total population, 302,318; deaths under 5 years, 35; total number of deaths, 117; annual rate per 1,000, 20.1.

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MAY 21, 1881. [No. 47.

MONTHLY REVIEW FOR APRIL, 1881.

The mean population represented in the reports for the four weeks ending April 30 is 50,113 less than that for the month of March. The general mortality is slowly increasing and has advanced from 23.32 to 24.88 per 1,000 per annum. The death-rate of children under 5 years has increased in nearly the same ratio, from 8.13 to 8.64 per 1,000. The monthly reviews so far have not included the record of *cerebro-spinal meningitis*, though this disease has been comprised in the weekly reports since January 1 of this year, in the new form of tables adopted at that time. The deaths from this cause for the first week in January were only 24, but the increasing mortality and the wide distribution of the disease have attracted attention, and its movement will be noted in future. For the present it can only be stated that from the rank of whooping-cough, one of the least fatal of our zymotics, cerebro-spinal meningitis has advanced to a position between scarlet fever and diphtheria, which are the leading causes of death among the contagious or infectious zymotic diseases in this country. The reports for the month of April do not indicate any regular increase in mortality from this disease, only the usual fluctuations being observed.

Causes of death.—The changeable weather of April has naturally augmented the mortality from consumption and acute lung diseases, which has risen 38 per cent. since March. The increase is, however, remarkably unequal, being 33 per cent. for phthisis and only 5 per cent. for the acute diseases of the lungs. A slight increase is observed in all the zymotics, excepting diphtheria and malarial fevers. Small-pox in Philadelphia has fallen from 215 to 148 deaths, and is no longer reported from the Mexican border: the States in communication with Canada and with European ports now seem to be chiefly infected.

Distribution of diseases.—In the northeast section consumption and acute lung diseases have but a small share in the general increase of mortality from those causes, and the most marked changes are observed in scarlet fever, which has risen from 0.88 to 1.04, or 18 per cent., and in enteric fever, which has increased from 0.32 to 0.48, or 50 per cent. since March.

Southeast section.—Here consumption has remained stationary, while a fall of 18 per cent. is noted in acute lung diseases. Scarlet fever has increased from a rate of 0.78 to 1.28, or 64 per cent., and measles show a still greater advance, though still causing only 0.45 deaths per 1,000. Malarial fevers and diarrhœal diseases are gradually increasing their death-rates, but the latter are not yet to be ascribed to heat, as the month has been remarkable for a general low temperature.

Northwest section.—This section shows nearly the same increase in deaths from pulmonary affections as the northeast, but while consumption has advanced 24 per cent. the acute lung diseases have remained the same as in March. Diphtheria, scarlet fever, and enteric fever give a diminished mortality, but measles, whooping-cough, and malarial fevers have somewhat increased their rates. The reduction in the aggregate of deaths from small-pox has been noted, but the disease is still widely spread, and the 287 deaths reported in April are divided as follows: New York city, 46; Newburg, N. Y., 1; Binghamton, N. Y., 1; Hudson County, N. J., 20; Camden, N. J., 2; Philadelphia, 148; Pittsburgh, Pa., 2; Wilmington, Del., 13; Richmond, Va., 6; New Orleans, 1; Louisville, Ky., 2; Cincinnati, 1; Chicago, 31; San Francisco, 13.

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—United States Consul B. Gerrish reports for the month of March, 10 deaths from small-pox, 6 from typhoid fever, and 31 from other contagious diseases. Total deaths, 457; population, 215,140; annual death-rate 25.0 per 1,000.

BUENOS AYRES.—United States Consul E. L. Baker sends the following report for the year 1880:

The health of the city has been uniformly good during the year; no disease has been epidemic, and neither cholera nor yellow fever has appeared. Quarantine precautions have doubtless prevented the importation of the latter disease from Rio Janeiro during the hot months. During a portion of the year small-pox prevailed all over the city and caused 832 deaths in a population of about 270,000. The sanitary condition of the city is not satisfactory, owing to the want of proper drainage. A few years ago a vast system of sewerage was commenced and much money expended; but the fund being exhausted the work remains unfinished and there is none but surface drainage. But for all other conditions being highly favorable the filthy condition of the city would produce much sickness. Yellow fever was last epidemic in 1871, when more than 20,000 persons died of it in 4 months. The last visitation of cholera was in 1874, when it proved more fatal in the country than in the city.

The total number of deaths in 1880 was 7,073, or 26.1 per 1,000 of the population. Dr. E. R. Coni, of the Buenos Ayres Medical Association, has published tables showing that from 1869 to 1880 (both included) the population has increased from 177,787 to 270,708. The highest death-rate for any year noted was 106.3, for the year 1871, when yellow fever prevailed. In 1874, the year of cholera, the rate was 32.4. The mean for the five years ending December 31, 1880, has been about 25.6, and the death-rate for 1880 is the lowest noted in 12 years past. The rate was highest for the winter months (July, August, and September), being then 27.2 per 1,000; in the summer (January) the lowest rate, 26.1, was observed. Of the total deaths, 2,024, or 28.75 per cent., were under one year of age, and 3,577, or 50.6 per cent., were under 10 years. A great disproportion is observed as to sex, the deaths of males being 4,233 and of females 2,840; this disparity was chiefly among adults, being 2,240 males to 1,256 females; among children, 1,993 males to 1,584 females. Among the principal causes of death were, consumption 774; other lung diseases 462; infantile convulsions 247; meningitis 397; heart diseases 334; diphtheria 335; small-pox 832; typhoid fever 163; cancer 177. In 1875 there were 1,041 deaths from small-pox, but in 1878 the disease had nearly disappeared. Its return is ascribed to the arrival in the city of a number of Indians made prisoners on the frontier; small-pox soon broke out among them and thence spread through the city. The deaths from this disease were 83 in January, increased to 139 in May, and 112 in June, and then declined rapidly to 11 in January. The records for the past 10 years show 836 deaths from small-pox in 1872, only 76 the following year, then 525 for the next, and a maximum of 1,041 for 1875. In 1876 only 22 were reported, 12 the next year, and the least number, 7, in 1878. Then the outbreak of 1879 gave 429 deaths, and 832 occurred in 1880. Of these, 70 per cent. were under 10 years of age, and 78 per cent. were among the natives of the country, who do not form more than half of the population. The excess of deaths among natives as compared with foreigners is due to the prejudice against vaccination which exists among the former. Diphtheritic diseases caused 335 deaths in 1879, the mortality being about equally distributed among the twelve months. Typhoid fever was prevalent during 1880, and the increase and decrease of mortality from it corresponded closely with those from small-pox in time. The city of Buenos Ayres has been ceded to the Argentine Republic as its permanent capital, and its government is now under the direct control of the national Congress. It is probable, therefore, that in future more care will be taken to secure, record, and publish important statistics.

CHINESE CITIES.—The consuls at Amoy and Ningpo report those cities free from epidemic or contagious disease up to March 19. At Canton two cases of small-pox are noted March 7, and one death from typhus fever. March 14, one case of small-pox is reported.

CONSTANTINOPLE.—United States Consul G. H. Heap sends telegrams relating to the plague, up to April 18.

Dr. Zitterer gives a résumé of deaths reported for 28 days in March, showing that at least 460 deaths occurred at Nedjeff in that month, and complete returns give 791 deaths for the first 15 days of April.

Special dispatches from Dr. Zitterer report as follows:

April 8.—Plague still increasing at Nedjeff; 157 deaths in the 3 days ending April 6.

April 9.—No plague at Bagdad, but physicians kept there as reserves.

April 13.—Nedjeff evacuated; about 4,000 inhabitants put in camp on healthy ground, near Kafle. Djaara and two neighboring villages burnt. Plague of the worst type, and often fatal in 10 hours. There were 309 deaths in the 5 days ending April 11, not including deaths outside of the town.

April 18.—The extension of the disease beyond the *cordons* has been admitted, but Dr. Zitterer states that a single suspicious case will give rise to a general panic, even before its nature is known. Dr. Bartoletti, of the sanitary commission, urges the greatest care in obtaining and reporting details of the pestilence, so that reliable accounts may be officially given.

CONSTANTINOPLE.—United States Consul G. H. Heap writes as follows regarding the plague in Mesopotamia, under date of April 27:

The sanitary administration of Constantinople states that the plague in Mesopotamia has not diminished in intensity, and the number of deaths has not become less; but it gives the assurance, notwithstanding reports to the contrary, that the pestilence is still confined to its original limits, and has not passed the military *cordons* drawn around the infected districts. The troops have lately been re-enforced. The administration still thinks that the means adopted to suppress the disease will prove successful.

The telegrams of Dr. Zitterer, dated April 19, report that at Chafich, a village of 90 inhabitants, the plague appeared about the end of February, and by April 10 thirty of the people died. The remainder voluntarily evacuated the village. April 18 there were 60 deaths, and 71, April 19, at Nedjeff. Four cases had occurred among the soldiers. In consequence of the burial of bodies at Nedjeff, the people of Djaara bury the dead in four cemeteries between Djaara and Kamoul. That one nearest to Djaara contains already over 300 graves. April 18 there were 26 deaths reported.

GHENT, BELGIUM.—United States Consul A. Lefebvre reports for the month of March, 2 deaths from small-pox, 4 from typhoid fever, 2 from scarlet fever, and 6 from diphtheria. Total deaths, 355; population, 134,852; annual death-rate, 31.0 per 1,000.

Among other causes of death were: consumption, 56; other lung diseases 70, and 50 from diarrhœal diseases.

JAPAN.—United States Consul T. B. Van Buren reports from Kanagawa 169 deaths of natives, and one among foreigners, for the month of March. The only case in which the cause is given is one death from typhus fever.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer reports for the month of January 6 deaths from cholera, 13 from typhoid fever, and 11 from other contagious diseases. Total deaths 444, in a population of 270,261; annual death-rate 19.3 per 1,000.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports under date of April 16 that the sanitary condition of the town is excellent, and the health of the people continues good. No report of deaths is made.

NEW ZEALAND.—The reports for the month of February show that no epidemic or contagious disease prevails. For four of the principal towns 90 deaths are reported, and of these 28 were from diarrhœal diseases; the other zymotic diseases exist, but have caused only one death each from measles, scarlet fever, diphtheria, and whooping-cough. Consumption gives 8 deaths, being a little less than 9 per cent. of the total. In the United States the per cent. is usually about 14.

RIGA, RUSSIA.—United States Consul N. A. Bornhold reports for the month of February 395 births, and 307 deaths. Among the causes of death were, consumption 32, other lung diseases 23, small-pox 18, croup 16, scarlet fever 11, diphtheria 7, typhoid fever 7, puerperal fever 5, measles 5, whooping-cough 1, diarrhœa 2. Mean temperature 27°.

SANDWICH ISLANDS.—United States Consul D. A. McKinly reports for the month of March 177 deaths in Honolulu, of which 28 were under 5 years, and 13 over 70 years of age. During the same month of 1880 there were only 55 deaths. The increase is due to small-pox, which caused this year in March 123 deaths, leaving only 54 for other causes. Among these were, consumption 5, convulsions 2, dysentery 2, heart diseases 3, and puerperal 2.

SIERRA LEONE.—United States Consul J. A. Lewis forwards a report of the hospitals of this colony for the year 1880:

In these hospitals there were 650 patients admitted during the year, and 100 remained from 1879. Of these 750 there were discharged as cured, 361; as relieved, 132; as not relieved, 50, and 98 died. In the colonial hospital the least average space per patient in any ward was 1,212 cubic feet, and the greatest 2,979 feet. In Sherboro' Hospital 4,914 feet were allowed. The supply of pure water from mountain streams is unlimited, but the drainage and sewerage are defective.

In the Lunatic Asylum there were 18 patients admitted, the average number of inmates was about 38, and there were 11 deaths.

SYDNEY, AUSTRALIA.—The report for January shows the usual high rate of mortality among children, being 49 per cent. of all deaths in the city, and 68 per cent. in the suburbs. The births were 733, to 448 deaths.

In February, there were 628 births and 372 deaths. The infant mortality was 44.7 per cent. for the city, and 63.7 per cent. for the suburbs.

SANITARY LEGISLATION IN FLORIDA.

AN ORDINANCE THE BETTER TO SECURE AND PRESERVE THE PUBLIC HEALTH.

SECTION 1. The city council of the city of Pensacola do enact that the mayor shall at once issue his proclamation directing the establishment of quarantine to remain in force until removed by the board of health.

SEC. 2. The quarantine station shall be in Santa Rosa Sound, above Deer Point, and not less than one mile from the shore, and the quarantine hospital shall be at the Live Oak Plantation until otherwise directed.

SEC. 3. The board of health shall select a quarantine physician, who shall receive as compensation the amount that may be agreed upon between him and the board of health per month, in greenbacks. The quarantine physician shall charge the visiting fee in all cases where he attends patients, either on board ship or in quarantine hospital, and for all medicines and supplies furnished to the respective vessels, said fees to be collected from the masters of vessels to which such patients belong, and paid over to the city treasurer.

SEC. 4. The quarantine physician shall, as soon as quarantine is established, take his station at the quarantine hospital at Live Oak Plantation and remain within quarantine limits until the quarantine is removed, unless by special permit from the mayor.

The quarantine physician shall be at all times, between sunrise and sunset, ready to visit and board all vessels immediately on their arrival in the bay off Deer Point, at a point to be designated by a buoy, upon which shall be erected a flag-staff, showing a yellow flag. He shall show a yellow flag conspicuously in his boat to designate her character, and if any vessel shall, under any circumstances, pass by the quarantine boat or buoy, or refuse to obey the order of the captain of the guard or quarantine physician, the master or owner of any vessel so offending shall be held to answer in a fine not exceeding $500, and may be imprisoned until such fine with costs be paid.

SEC. 5. All vessels arriving after May 1, 1881, from Key West or any port in the West Indies, Central America, South America, or Mexico, or any other port where malignant or contagious diseases may be prevailing, or having on board any person ill with any disease of malignant or infectious character, shall be sent to the quarantine station and required to discharge their ballast or cargo, under the direction of the quarantine physician, and undergo such fumigation and cleansing as the quarantine physician may deem necessary, paying such fees or compensation therefor as the board of health shall prescribe.

The ballast shall be discharged in the ballast crib or as the quarantine physician may direct.

SEC. 6. The quarantine physician shall examine into the condition of every vessel going into quarantine and the health of the persons on board, and shall not permit any vessel, or person from any vessel, to approach the city until the requirements of the preceding section have been fulfilled; and further, until he is satisfied that the public health will not be endangered thereby; and further, until said permit is countersigned by the mayor and president of the board.

SEC. 7. All vessels entering the bay of Pensacola shall proceed directly to the quarantine, and no vessel shall anchor inside of the bar before she arrives at quarantine, except in cases of imperative necessity, in which case she shall at once make signal by hoisting her ensign with a wife (that is, tied around the middle), which will be a signal for a tug to come immediately. Any master or pilot violating this section shall be fined in a sum not exceeding three hundred dollars.

SEC. 8. It shall be the duty of pilots or other persons bringing vessels into the bay of Pensacola to hoist a flag at half-mast at the fore, and not to pass the quarantine buoy until the vessel has been visited by the quarantine physician; and it shall not be lawful for any person to visit or communicate with any vessel being taken into quarantine or in quarantine until said vessel has been visited by the quarantine physician and relieved from quarantine; and not then without a written permit from the quarantine physician, countersigned by the mayor and president of board of health.

Any person found guilty of violating the provision of this section shall be fined in a sum not exceeding three hundred dollars; and any master of a vessel permitting any such communication shall also be fined in a sum not exceeding three hundred dollars.

SEC. 9. No pilot or other person shall leave a vessel, after coming into Pensacola Bay, without a written permit to do so from the quarantine physician.

SEC. 10. All vessels at quarantine shall keep a flag at half-mast at the fore during the day, and a lantern in the same position at night.

It shall be the duty of the quarantine physician to cause any vessel having sickness on board to be anchored at least half a mile from other vessels which have no sickness on board, and it shall be his duty to prohibit any intercourse whatever between vessels in quarantine.

Should any such intercourse take place it shall be his duty promptly to report it to the mayor, and the master of every vessel so offending shall be fined in a sum not exceeding three hundred dollars.

SEC. 11. Any person visiting, or attempting to visit, the hospital

without permission from the quarantine physician shall be fined in a sum not less than three hundred dollars.

SEC. 12. Vessels at quarantine requiring fresh provisions shall communicate with the quarantine physician, who shall procure the same, if he deems it expedient, taking care that there is no intercourse between the ship, or boats belonging to the ship, and the parties furnishing the supplies.

SEC. 13. It shall be the duty of the quarantine physician to visit every vessel coming from any port and entering the bay of Pensacola. He shall require the captain of every vessel thus inspected to pay the sum of five dollars.

SEC. 14. Each and every vessel fumigated shall pay for such fumigation at the rate of twenty-five dollars for every vessel not exceeding 500 tons; forty dollars for vessels above 500 and not exceeding 750 tons, and fifty dollars for every vessel of 750 tons and upwards, and the cost of the disinfectants necessarily used; and for discharging ballast at the crib fifty cents per ton; which said fees, together with all other quarantine dues, shall be collected in currency or by order on consignee by the quarantine physician, and sent forthwith to the city treasurer to be set aside as quarantine fund, and paid out only on order of board of health.

SEC. 15. The quarantine physician shall make a weekly report to the board of health, showing the number and class of vessels visited by him, amount of fees collected, number of patients treated, and quantity of ballast discharged, and any other matter which may be of interest.

SEC. 16. That every pilot and pilot boat on the bay of Pensacola, and master of tug, shall be supplied with copies of this ordinance, and it shall be the duty of every pilot to furnish a copy of this ordinance to the master of every vessel which said pilot may speak or board, immediately upon said communication.

SEC. 17. Any violation of the quarantine shall be published in the manner prescribed by act regulating quarantine, passed by the legislature and approved March 11, 1879.

SEC. 18. All tugs (except when taking vessels into quarantine) and all crafts of every character going into or coming out of, or passing through quarantine lines, shall lay-to off, and as near the guard station as practicable, designated by a blue flag, and remain there until visited by the officer in charge of the guard and permitted by him to pass.

SEC. 19. That these rules and regulations shall continue in force until repealed, and all rules and regulations or ordinances in conflict or inconsistent with them are hereby repealed.

Adopted April 26, 1881.

ALOYSIUS RAUCH,
President City Council.

Approved April 27, 1881.

J. M. TARBLE, *Mayor.*

SANITARY INSPECTION IN THE MISSISSIPPI VALLEY.

The following resolutions have been passed by the Tennessee State Board of Health:

NASHVILLE, *April 6*, 1881.

Whereas it is believed that public confidence was preserved and a sense of security engendered throughout the Mississippi Valley by the operations of the inspection service of the National Board of Health during the summer of 1880; and

Whereas it is desirable that such well-grounded confidence and security be perpetuated in the interest of commercial and material progress, as well as in "the interest of health and life of the citizens of this State," with the general supervision and protection of which this board is charged by law; therefore, be it

Resolved, That the National Board of Health be, and it is hereby, invited to co-operate with and aid the State Board of Health of Tennessee in the execution and enforcement of its rules and regulations to prevent the introduction of contagious or infectious diseases.

Resolved, That in view of the increased facilities of communication with the Gulf and South Atlantic ports, the National Board is respectfully requested to advise, promptly, this board of health of threatened danger from that source at any time, together with such suggestions connected therewith as it may be proper to make.

Resolved, That this board formally approves and indorses the action of the board of health of the city of Memphis as set forth in the following resolutions adopted at a special meeting held on the 29th day of March 1881, as follows:

"*Resolved*, That the National Board of Health be respectfully requested to place on duty at New Orleans, and such other Southern ports as may be deemed necessary, an inspector or inspectors whose duty it shall be to supervise the shipment by river or rail of all goods, merchandise, baggage, &c., and to advise (by cipher telegram) the resident member of the National Board of Health in this city, or in the event of his absence, his official representative, whenever such shipments are believed to be infected, or in any wise dangerous to public health; and that the National Board instruct its resident member to promptly inform this board of the shipment of such infected or dangerous goods, &c., to this city.

"*Resolved*, That the quarantine grounds and buildings on President's Island be again tendered to the National Board of Health for use as an inspection station for the enforcement of the quarantine ordinance of the taxing district, which takes effect May 1, proximo, and for the general purposes of the inspection service of the National Board.

"*Resolved*, That copies of these resolutions and quarantine ordinance be transmitted to the secretary of the National Board of Health in Washington."

Resolved, That the secretary be, and is hereby, instructed to furnish a copy of above resolutions to the secretary of the National Board of Health, and the boards of health and sanitary council of the Mississippi Valley.

Attest:

W. M. CLARK, M. D.,
Secretary State Board of Tennessee.

In relation to the above resolutions, Dr. Clark makes the following observations:

At the meeting of April 5, without surrendering in any respect the rights or evading any duties, this board invited the co-operation of all other health organizations in effecting the protection of the public health. This invitation involves a reciprocal obligation on the part of this board, and I am authorized to express its desire for uniformity and concert of action with similar institutions. The "inspection service" of the National Board of Health presents a common basis to all, and from the indorsements it received last year from so many sources (see Supplement to Nat. B. of H. Bulletin, No. 12), we are warranted in requesting a continuance of the same. Should it at any time prove unsatisfactory, our organizations will be ever in readiness to supplement its efforts.

FEES FOR INSPECTION OF VESSELS.

The Secretary of the Treasury sends the following note to the National Board of Health:

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY,
Washington, D. C., May 12, 1881.

SIR: Your letter of the 7th instant is received, requesting a modification of the schedule of fees for medical examinations of persons on American vessels bound for the United States, established by department letter of November 29, 1880, in pursuance of the act to prevent the introduction of contagions or infections diseases into the United States, approved June 2, 1879.

It appears that the fee of five dollars for inspections of persons where there are fifty or less upon a vessel, has been found very burdensome upon sailing vessels, and you recommend that it be modified by scaling, and "that consular officers at infected ports may remit at their discretion the collection of inspection fees from vessels without passengers that have paid the same within two months previous to the last inspection, provided there has been no change in their respective crews."

In accordance with your request, the schedule of fees prescribed in department letter of November 29, 1880, is hereby amended to read as follows:

Fees for medical examination of persons on vessels bound from foreign ports to ports in the United States, for twelve persons and under	$1 50
For over twelve and not over twenty persons	2 50
From twenty to one hundred, for each ten persons or less	1 00
Over one hundred, at the rate of	5 00

for each additional hundred persons.

And consular officers are hereby authorized, in their discretion, to abstain from the collection of such fees from vessels without passengers that have paid the same within two months previous to the last inspection, *provided* there has been no change in their respective crews.

Very respectfully,

WILLIAM WINDOM,
Secretary.

J. L. CABELL, M. D.,
President National Board of Health, Washington, D. C.

QUARANTINE REGULATIONS FOR MISSISSIPPI.

The following resolution was passed by the board of health of Harrison County, Miss., May 3:

Resolved by the board of health for Harrison County, Miss., That on and after the 15th day of May, 1881, all vessels arriving at the ports of said county from infected ports shall be subjected to a quarantine of ten days or more, at the discretion of the health officer, said quarantine to continue until otherwise ordered.

Dr. T. S. Seales, inspector for the National Board of Health at Ship Island, acknowledges the receipt of the above resolution, and will carry its provisions into effect.

QUARANTINE PROCLAMATION.

The following proclamation has been issued by the mayor of Pensacola, Fla.:

MAYOR'S OFFICE, *April* 18, 1881.

At a meeting of the board of health, held April 16, 1871, it was—*Resolved*, That the mayor shall issue his proclamation directing the establishment of quarantine, the same to commence on 1st day of May, 1881, and remain in force until removed by the board of health.

In obedience to the above resolution, notice is hereby given that on and after the 1st proximo, quarantine will go into effect. Pilots and masters of tugs, bringing vessels into port, will hoist a flag at half-mast at the fore, and take them to the buoy off Deer Point, where they will remain until disposed of by the quarantine physician. No person after that date will be permitted to go on board of said vessel until boarded by quarantine physician, and released from quarantine. The naval guard stationed at Deer Point, by courtesy of the naval authorities, are clothed with the execution of the rules of board of health.

The orders of the guard, in executing said rules and instructions, must be respected by all vessels and persons in the bay, between Clapp's Woods on west side of Quarantine Station and Town Point, and extending to a line across Santa Rosa Sound, three miles east of Deer Point.

By order of the board of health.

J. M. TARBLE, *Mayor.*

S. T. PONS, *Quarantine Clerk.*
PENSACOLA, *April*, 1881.

[Continued from BULLETIN No. 44.]

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

By STEPHEN SMITH, A. M., M. D., of New York.

MASSACHUSETTS—Continued.

In 1701-'02 "An act providing in case of sickness," was passed:

Be it enacted by the Lieutenant Governour, Council, and Representatives in General Court assembled, and by the authority of the same,

. . . . . .

SECT. 4. That if any person or persons, seamen or passengers, belonging to or transported in any ship or vessel, arriving to any port or harbour within this province, happen to be visited with the plague, small pox, pestilential or malignant fever, during the voyage, or to come from any place where such sickness prevails and is common, any justice or justices of the peace within the county, to whom the notice or information thereof shall be given, shall forthwith take care to prevent and restrain all persons belonging to or transported in such ship or other vessel from coming on shore, and if any be before on shore to send them on board again, as also to restrain persons from going on board such ship or vessel; and to that end may make out a warrant, directed to the sheriff of the county or his deputy, or constables of the same town, who are accordingly impowred, and required to execute the same.—

And such justice or justices are forthwith to transmit the intelligence thereof to the governour or commander-in-chief for the time being, who is hereby impowred, with the advice and consent of the council, to take such further order therein as they shall think fit for preventing the spreading of the infection.

[*Passed June* 25, *Published June* 28.]

Hitherto the Province of Massachusetts Bay had been without a quarantine hospital; accordingly, on the 11th of June, 1716, a committee was appointed to investigate a proper location. On the 23d November, in the same year, they made the following report:—

Nov. 23, 1716. The report of the Committee appointed the eleventh of June last to Investigate a suitable Place for an Hospital for infectious Persons viz.

In Obedience to the aforegoing Order We have searched both by Land and Water the most convenient Places in & about Boston Harbour, & find Spectacle Island & Squantum Neck to be the two most convenient Places for such an Hospital, & discoursed the owners about it.

Mr Bill refuses to sell any Part of Spectacle Island in Fee, but demands ten Pounds per Annum for the Use of one Acre of his Land for that Service. Mr Bull demands Fifty Pounds for one Acre in Fee upon the South East Part of the Moon, and Liberty to pass and repass, Which Place being equally convenient with the other, besides that it is to be bought outright, that it lies more out of the common Road of Shipping & that it can be come at both by Water & Land, We recommend that as the fittest place: We herewith offer the Draught of a House, Which we reckon most agreeable to that occasion, The Charge whereof with a Well, Fencing, a Shed to House infectious Goods in & other Accommodations We compute will amount to between One Hundred & fifty & Two Hundred Pounds: We offer also some Minutes Which we judge convenient to be drawn into An Act: All which is humbly submitted to this Honble Court

By Order of the Committee

ADAM WINTHROP

Boston Nov. 15, 1716

The following Vote pass'd in the House of Representatives upon the aforegoing Report of the Committee; Read and Concurr'd: Viz,

"Voted that this Report be so far Accepted, that the Acre of Land mentioned therein on Squantum Neck with necessary Privileges be purchased & paid for out of the publick Treasury, The Title to be vested in the Province Treasury for the Time being for the Use of this Province.

That One Hundred & fifty Pounds be allowed out of the publick Treasury for erecting necessary Buildings &c. thereon; That Samuel Thaxter & William Payne, Esqrs be a Committee to take Care for the Building & Fitting the Hospital as soon as may be; And that the said Committee prepare and lay before this Court a Draught of a Bill enacting as they shall think necessary on this Occasion.

Consented to, SAMUL SHUTE

[*Council Records, Vol. X., pp.* 122-3.]

"April 11, 1717. The following Order pass'd in the House of Representrs Read and Concurr'd: Viz, Upon Reading a Petition of a considerable Number of the Inhabitants of the Towns of Dorchester, Braintree & Milton Praying that a Hospital for the Entertainment of Infectious Persons may not be Erected on Squantum Neck in Dorchester aforesaid, As has been proposed in the Committees Report appointed for that Purpose. Ordered that Adam Winthrop, William Payne, Samuel Thaxter & Jonathan Dowse Esqrs be a Committee to find out & agree for a more suitable Place for the Building a Hospital, That it may be Erected with all convenient Speed;

Consented to, SAMUL SHUTE."

[*Ibid., pp.* 141-2.]

"May 15, 1717. In answer to a motion of a Committee of ye Genll Assembly,

Voted, That the Selectmen be impowered to Lease a piece of Land on Dere Island not exceeding one acre, for a Term not exceeding ninty nine years to be improved for the erecting an Hospitall or Pest House there for the reception and entertainment of sick persons comeing from beyond sea, and in order to prevent the Spreading of Infection." [*Boston town-records, Vol.* 2, *p.* 373.]

Aug. 9, 1717. Samuel Bill and wife conveyed, for £100, to Jeremiah Allen, treasurer of the province, and his successors, the southerly end of Spectacle Island. (See Suffolk Registry of Deeds, lib. 32, fol. 44.) By this deed it appears that the cellar of the hospital had been already dug. (See, further, Shurtleff's Topographical and Historical Description of Boston, pp. 512-515.)

"Oct. 29, 1717. An Accompt of the Charges on the Hospital built on Spectacle Island amounting to One Hundred & seventy three Pounds, Was given in to the House of Representatives by Coll. Thaxter and Mr Wm Payne

Read & Committed; Read & Resolved that so much be further allowed & paid out of the publick Treasury, as with what has been already paid on this Account shall make up the sum of One Hundred and seventy three Pounds to discharge this Accompt.

And the Committee are desired to proceed in making a Fence & Well at the best Rate they can: Sent up for Concurrence, Read & Concurr'd:—

Consented to, SAMUL SHUTE

Council Records, p. 188.

"Nov. 28, 1719. A Petition of Samuel Bill of Boston shewing that upon his Petition presented to the General Assembly at their Session in October 1718 he obtained a Vote for Three Pounds as a Recompence for his Damage sustained from those that were Ordered by this Government to abide on Spectacle Island, that he humbly conceives his Allowance would have been much greater had he particularly sett forth his Damage, which is as follows, While the Hospital was building on the said Island seventy Passengers from Ireland, in a Vessel that had the Small Pox were put on Shoar on the Island by Order of the Government & tarried there six Weeks in which time they trod down several Acres of Grass fit for Mowing, & cut down nine or ten large Trees, that some of the poor People being sick and in perishing Circumstances, the Petitioner spent above three Pounds in Relieving them, that since the Building the Hospital he has supplied it with Water & has been serviceable in Making Fires & looking after the said Hospital, the Key thereof being committed to him, & that he takes Care that it be wholesome & fit for the Reception of sick People: And therefore humbly Praying that this Honble Court would consider his Losses & how slender an Allowance has been already made for the same, And seeing they have been occasioned by the Act of the Government, in Placing the Hospital on the said Island & Ordering sick People there, That they would in their great Justice & Goodness Order him such an Allowance, as they shall think proportionable to his Services & Damages as aforesaid.

In the House of Representatives: Read & Resolved that the Sum of Twelve Pounds be allowed and paid out of the publick Treasury to Samuel Bill the Petitioner in full of all damages mentioned in his Petition. In Council: Read & Concurr'd:—

Consented to, SAMLL SHUTE"

[This article will be continued in a future BULLETIN.]

DIAGRAM TO SHOW THE PROPORTION OF DEATHS PER 1,000 PER ANNUM AS RECORDED IN THE MORTALITY REPORTS FURNISHED THE NATIONAL BOARD OF HEALTH FOR THE FOUR WEEKS ENDING APRIL 9, 16, 23, AND 30, 1881, FROM THE FOLLOWING PLACES.

[Oblique lines represent mortality under 5 years; horizontal lines represent mortality over 5 years; both represent total mortality per 1,000 per annum.]

LA SALLE, ILL.—Under date of May 14, Dr. F. Clendenen reports two deaths from typhus fever, which occurred among Polish emigrants who had arrived there only a few days before.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NATIONAL BOARD OF HEALTH rooms, 1410 G st., N. W.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING MAY 7, 1881.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

DAVID'S ISLAND, N. Y.—Under date of May 11, Surgeon George P. Jaquette, U. S. A., reports that two cases of small-pox had recently occurred at the post; one has recovered and the other is still under treatment. No details are given as to the history or the origin of the disease. The post is some 30 miles from New York City.

FORT LARAMIE, WYO.—Acting Assistant Surgeon A. P. Frick, U. S. Army, reports the arrival at the post on April 17, of a boy six years of age, who had left Wilmington, N. C., April 11, and came by way of Washington, Saint Louis, Omaha, and Cheyenne. Immediately after arriving at the post, scarlet fever was developed, and if eight days be allowed for incubation, the infection must have been received at Wilmington, while a shorter period assigned would leave the case due to infection upon the route.

HAVANA, CUBA.—During the week ending April 29, there were 2 deaths from yellow fever, 20 from typhoid fever, and 11 from small-pox. During the week ending May 5 there was but 1 death from yellow fever. Typhoid fever caused 10 deaths and small-pox 24. At the close of the week no case of yellow fever was known to exist among the shipping.

MUSCATINE, IOWA.—Under date of May 9, Dr. W. S. Robertson, president of the State board of health, announces the election of Dr. R. J. Farquharson as secretary of the board.

NASHVILLE, TENN.—The secretary of the State board of health gives the date of March 30, 1881, for the passage of the act providing for registration of births, marriages, and deaths in Tennessee. The act was published in No. 12 of the Bulletin, p. 766, but the date was not given.

PATERSON, N. J.—Dr. W. K. Newton, under date of May 13, gives the following list of gentlemen appointed as public analysts by the New Jersey State board of health, under the act published in the BULLETIN May 7:

C. F. Brackett, M. D., Ph. D., president of council, and professor of physics, Princeton College.
William H. Newell, M. D., clerk of council, Jersey City.
H. B. Cornwall, professor of analytical chemistry, Princeton College.
A. R. Leeds, Ph. D., professor of chemistry, Stevens Institute, Hoboken.
William K. Newton, M. D., Paterson, N. J.
Shippen Wallace, analytical chemist, Burlington.
F. C. Van Dyck, professor of chemistry, Rutgers College, New Brunswick.

THE NATIONAL BOARD OF HEALTH.

OFFICERS.

JAMES L. CABELL, LL. D., &c.....*President.*
JOHN S. BILLINGS, Surgeon United States Army.....*Vice-President.*
THOMAS J. TURNER, Medical Director United States Navy.....*Secretary.*

MEMBERS.

PRESTON H. BAILHACHE, M. D., U. S. M. H. S., 509 Maple ave., Le Droit Park, Washington, D. C.
SAMUEL M. BEMISS, M. D. &c., 558 Saint Charles street, New Orleans, La.
JOHN S. BILLINGS, M. D., United States Army, 84 Gay street, Georgetown, D. C.
JAMES L. CABELL, M. D., &c., University of Virginia, Va.
CHARLES F. FOLSOM, M. D., &c., 113 Boylston street, Boston, Mass.
HOSMER A. JOHNSON, M. D., &c., 4 Sixteenth street, Chicago, Ill.
ROBERT W. MITCHELL, M. D., &c., 34 Madison street, Memphis, Tenn.
SAMUEL F. PHILLIPS, esq., Solicitor General, 1119 K street, Washington, D. C.
STEPHEN SMITH, M. D., &c., 31 West Forty-second street, New York.
THOMAS J. TURNER, M. D., U. S. N., 1227 M street, N. W., Washington, D. C.
TULLIO S. VERDI, M. D., &c., 815 Fourteenth street, N. W., Washington, D. C.

The following reports for the week ending May 7 are from places in which burial permits are not required:

Allegheny, Pa., 79,000; deaths, 39; under 5 years, 23; accident 2, cerebro-spinal meningitis 2, consumption 2, croup 2, scarlet fever 8, pneumonia 2, puerperal 1, whooping-cough 1. Bath, Me., 8,000; deaths, 4; under 5 years, 3; consumption 1. Belfast, Me., 5,308; deaths, 2. Brattleborough, Vt., 6,000; deaths, 6; under 5 years, 1; consumption 1, pneumonia 2. Bucyrus, Ohio, 3,950; deaths, 3; under 5 years, 2; whooping-cough 2. Calais, Me., 6,172; deaths, 1; congestion of lungs 1. Carrollton, Miss., 900; no deaths. Chillicothe, Ohio, 11,000; deaths, 4; under 5 years, 1; scarlet fever 1, pneumonia 1. Clinton, Mich., 1,200; deaths, 1; under 5 years, 1; scarlet fever 1. Coldwater, Mich., 4,800; deaths, 3; consumption 2. Columbus, S. C., 11,000; deaths, 3; under 5 years, 1; diarrhœa 1, puerperal 1. Columbus, Ga., 10,000; deaths, 4; under 5 years, 1; consumption 1. Corinth, Miss., 2,264; no deaths. Dallas, Tex., 12,000; deaths, 1. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Greenville, S. C., 6,500; no deaths. Gunn City, Mo., 150; no deaths. Hernando, Miss., 1,000; deaths, 2; pneumonia 1, malarial fever 1. Humboldt, Tenn., 2,000; deaths, 3; meningitis 3. Huntingdon, Tenn., 1,200; no deaths. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; deaths, 1; measles 1. Jefferson, Tex., 3,250; deaths, 2; under 5 years, 1; consumption 1. Kenosha, Wis., 5,500; deaths, 3; consumption 1, congestion of lungs 1. La Salle, Ill., 8,885; deaths, 1; under 5 years, 1; cerebro-spinal meningitis 1. Louisiana, Mo., 5,200; deaths, 2; under 5 years, 1; consumption 1, congestion of lungs 1. Madison, Ind., 9,009; deaths, 6; under 5 years, 2; accident 1, pneumonia 2. Martinsburg, W. Va., 6,334; deaths, 1; consumption 1. Meridian, Miss., 4,013; deaths, 1; consumption 1. Milan, Tenn., 1,800; deaths, 2; under 5 years, 1; pneumonia 1. Milledgeville, Ga., 3,000; no deaths. Muscatine, Iowa, 8,412; deaths, 3; cerebro-spinal meningitis 1. Ocala, Fla., 1,000; no deaths. Painesville, Ohio, 5,504; deaths, 1. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; deaths, 1; under 5 years, 1; congestion of lungs 1. Port Gibson, Miss., 1,200; deaths, 2; malarial fever 1, pneumonia 1. Port Royal, S. C., 750; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, Cal., 5,000; deaths, 1. Senatobia, Miss., 935; no deaths. Starkville, Miss., 1,454; deaths, 1; consumption 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; deaths, 1. Tuscaloosa, Ala., 2,000; deaths, 2; pneumonia 1. Winona, Minn., 10,000; deaths, 9; under 5 years, 2; consumption 3, diphtheria 1, erysipelas 1, malarial fever 2, congestion of lungs 1, measles 1. Youngstown, Ohio, 15,421; deaths, 2; malarial fever 1. Total population, 281,366; deaths under 5 years, 42; total number of deaths, 117; annual rate per 1,000, 21.7.

CORRECTION.—In the paper of Dr. Sternberg, BULLETIN No. 44, the following typographical errors are to be noted: The abbreviation for "cubic centimetre" should be c. c. in every case. Page 781, first column, for "putrid wine" read *putrid urine;* six lines below, for "diatorus" read *diatoms.* Page 782, first column, in first *note*, for "putrefaction" read *putrefactive;* second column, 8th line from bottom, for "they are" read *there are.*

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, MAY 28, 1881. [No. 48.

[Continued from BULLETIN No. 47.]

THE ORIGIN AND GROWTH OF THE QUARANTINE SYSTEMS OF THE UNITED STATES.

By STEPHEN SMITH, A. M., M. D., of New York.

MASSACHUSETTS—Continued.

In 1717–'18 the following act, "An act in addition to an act intituled 'An act providing in case of sickness'" was passed :—

Whereas there is now provided at the charge of the province a convenient house on the island called Spectacle Island, for the reception of such as shall be visited with contagious sickness, to keep them from infecting of others,—*Be it therefore enacted by the Governour, Council, and Representatives in General Court assembled, and by the authority of the same.*

SECTION 1. That the Keeper of the lighthouse and the commanding officer of Castle William shall notify and direct the masters of all vessels coming near them, wherein any infectious sickness is or hath lately been, at their coming in, to come to anchor as near the beforementioned house as may be, that the sick persons and everything else on board said ship that may give infection (proper to be put into the said house), may be removed into it with the greater ease and safety.

SECT. 2. That if any master or immediate commander of any such vessel, for the time being, in disobedience to such orders or contrary to this act, come with his vessel, or suffer her to be brought up above the said castle, come himself, or suffer any of his people or passengers to come ashore, or any boats to come on board, or suffer any goods to be taken out of his vessel, without leave first obtained from the governour and council, or two justices of the peace, and the selectmen of the town of Boston, he shall, for every such offence, forfeit the sum of fifty pounds; and in case he be not able to pay that sum, he shall suffer six months' imprisonment. And the master of every such vessel is hereby directed and impowered to put into the said house, or where the said selectmen shall direct, all such goods as, in the opinion of said selectmen, may carry an infection in them, under the penalty aforesaid.

SECT. 3. That if any sailors or passengers coming in such vessel shall, without the knowledge or consent of the master, presume to come on shore, or up above the said castle, or if any person, from town or country, presume to go on board such vessel, or go to the aforesaid house or hospital in time of infection then, without leave from the authority aforesaid, or if any person put sick into the said house shall presume to go off the island without leave as aforesaid, every person offending in any of the abovementioned particulars shall forfeit the sum of ten pounds; and in case any person be not able to pay said sum he shall suffer two months' imprisonment.

SECT. 4. All the abovementioned fines to be sued for and recovered by the province treasurer, for the time being; one-third of the fines to be to his majesty for the use of this government, one-third to the informer, and one-third to the province treasurer, for the time being.

SECT. 5. And when and so often as any ship or other vessel shall come to any port or harbour within this province, wherein any infection or infectious sickness is or hath lately been, the justices and selectmen of such place be impowered immediately to order the said vessel and sick persons to the province hospital or house aforesaid, there to be taken care of according to the directions of this act. And when any such ship, vessel or persons cannot without great inconveniency and damage be ordered to the aforesaid house or hospital, in every such case the rules and directions of the aforementioned act already made in case of sickness are to be observed.

SECT. 6. And all repairs and whatsoever is necessary for the accommodation of such persons, shall be taken care of and provided for by the selectmen of the town of Boston aforesaid, at the immediate charge of the province: *provided, nevertheless,* that this is not to be understood to excuse any persons or towns, who, according to the afore-mentioned law, are obliged to defray the charge that may be occasioned by their sickness or continement in the said hospital.

SECT. 7. This act to continue in force until the end of the session of this Court, which will begin in May, *anno* one thousand seven hundred and twenty-three, and no longer.

[*Passed February* 14, 1717–18.]

At a session held in May, 1723, the above act was continued until the end of the session of the general court in May, 1728.

In 1721–'22 an act was passed to oblige all ships and other vessels coming from France, and other parts of the world infected with the plague, to perform quarantine.

Whereas the plague and other pestilential and mortal distempers are oftentimes transported from one country to another, even over seas, in ships and goods, and the Kingdom of France, and other parts of the Mediterranean, are at this day sorely visited with the plague, and from thence vessels frequently arrive in this province, especially during the summer season, which it is to be feared may bring the pestilence into this country unless great care be taken to prevent the same,—

Be it enacted by His Excellency the Governour, Council, and Representatives in General Court assembled, and by the authority of the same,

SECTION. 1. That every ship or vessel coming from any of the ports of France, or the Mediterranean, shall, before they unlade any goods or part of their cargo, be obliged to perform quarentine at least forty days immediately after their arrival, at such place as shall be assigned by the governour and council for that purpose; and every master or commander of such ship or vessel, being notified of this act by some justice of the peace or publick officer, that shall presume to unlade any part of his goods or cargo, before he have perform'd such quarentine, or refuse to perform quarentine at such place as he is ordered by the governour and council, shall be deemed a felon, and suffer the pains of death.

SECT. 2. That if any master, passenger, sailor or other person on board any such ship or vessel, shall presume to come on shore until the said ship or vessel have performed her quarentine, or without express license obtain'd from the governour and council, he shall suffer three years' imprisonment without bail or mainprize.

SECT. 3. And the master or Keeper of the province lighthouse is hereby impower'd and commanded to notify the commanders or masters, of all such ships or vessels arriving at or near Nantasket, that may be supposed to come from places infected with the plague, and give strict charge and notice of this act and the pains and penalties thereof.

SECT. 4. That all ships or vessels arriving from Newfoundland, Cape Breton, Canso, or those ports that have been at any time within the space of six months next preceding, in any part of France, or other places infected with the plague, or that have, during their being at Newfoundland, Cape Breton or Canso, taken on board any goods or lading coming from France or other places infected with the plague, shall also be obliged to perform quarentine, as aforesaid, and the master or commander thereof[1] under the same penalties, as aforesaid, as to unlading any part of their cargo, or refusing to perform quarentine, as aforesaid. And, for the better preventing the unlading or delivering of any goods out of any ship or vessel coming from any of the places aforesaid, before the master of such ship or vessel can or may be notified of this act, as before directed,—

SECT. 5. That in case it appear by due course of law, that any goods, wares or merchandize whatever be unladed or delivered out of such ship or vessel before she have perform'd her quarentine, as aforesaid, the master or commander of such ship or vessel shall forfeit and pay the sum of five hundred pounds, the one-half thereof to the use of him or them that shall inform and sue for the same, and the other half to be towards the support of his majesty's government of this province; and further suffer three years' imprisonment without bail or main prize.

SECT. 6. That any person or persons that shall any ways be aiding or assisting to unlade any goods or merchandize out of any ship or vessel coming from any of the aforesaid ports, or any other infected places, as aforesaid, shall pay a fine of one hundred pounds, one-half to him or them that shall inform or sue for the same in any court of record, and the other half to be to and for the use and support of his majesty's government of this province; and shall further suffer twelve months' imprisonment without bail or mainprize; any law, usage or custom to the contrary in any wise notwithstanding.

SECT. 7. This act to continue in force for the space of three years from the publication thereof, and no longer.

[*Passed September* 2.]

The cause which gave rise to the above act in all probability terminated before, or at the expiration of the three years, as no reenactment appears in the State records.

[1] *Sic.*

In 1728–'29 an act was passed entitled "An act in addition to an act entit[u]led 'An act providing in case of sickness.'"

This act is in substance the same as that passed in 1717–18, renewed in May, 1728, of which we quote only—

"SECT. 7. This act to continue in force until the end of the Session of this Court which will begin in May, one thous[an]d seven hundred and thirty-eight and no longer." [*Passed June* 19th; *published June* 24.]

The Spectacle Island Hospital continued for the reception of infectious diseases until the year 1737.

"From this time [meaning when the hospital was finished and made comfortable for the entertainment of the sick], things went on well at the hospital; repairs, when needed, were made, and everything required for comfort was provided by the town, and paid for by the province. In January, 1735–6, a committee was appointed, and further impowered on the twenty-fourth of March following, for agreeing with the owners of any convenient place as they may think suitable for removing the hospital to, in the harbor of Boston. This committee after being reminded of their duty on the twenty-fifth day of November, reported on the second of December, 1736, that they had performed their duty, and recommended, that the sum of five hundred and seventy pounds be granted and paid out of the public treasury to the Honorable John Jeffries, Esq., and the other select men of Boston, by them to be disposed of for the consideration purchase of a certain island in the harbor of Boston, called Rainsford's Island, lying between Long Island and the main land near the town of Hull, to be improved as a Hospital for the Province. At the same time M[r] Treasurer Foye was authorized to execute and pass a deed of sale to Richard Bill, Esq., of Boston, of all the right, title, and estate of the province in that part of Spectacle Island, with the buildings and appurtenances, where the hospital then was, on the receipt of the sum of one hundred and thirty pounds.

"On the thirteenth of December, 1737, the committee reported that they had built a hospital upon Rainsford Island; therefore, that upon Spectacle Island became of no use to the province, and was accordingly sold to Richard Bill, of Boston, and conveyed to him by deed dated seventeenth February, 1738–39."

[See Topographical and Historical Description of Boston, by N. B. Shurtleff, pp. 575–6.]

CHAP. 8.—"February 4, 1736–7. In the House of Represent[ves] Voted That M[r]. Speaker & M[r] Cook with such as shall be Joined by the Hon[ble] Board, be a Comm[tee] to build a sutable and convenient House on Rainsfords Island lying between Long Island & the Main Land near the Town of Hull to be used & Improved as a publick Hospital for the Reception & Accomdation of such sick & infectious persons as shall be sent there by Order—

In Council: Read & Concurr'd & William Dudley & Sam[l] Welles Esq[rs] are Joined in the Affair,—

Consented to, J. BELCHER."

[*Council Records, Vol. xvi., p.* 454.]

"October 18, 1737. In the House of Represent[ves] Read & Ordered that the present Select men of the Town of Boston be and hereby are fully authorized and appointed a Committee to treat with some suitable person to keep the Hospital lately built by Order of this Court at Rainsford's Island, for the reception of the sick and infectious persons, and that the said person be desired and impowered to take all proper care of such Persons as shall be sent to the said Hospital, for twelve months next; And that the Committee agree with the Person for taking care of the sick &[c] for his time and service therein for the year; And that they render an account of their doings in the premises with an accompt of the Issues and Profits which may arise by the produce of the Island the next season, to this Court, in the Fall Sessions of the next year.

In Council; Read and Concurr'd."

[*Ibid., Vol. xvii., b.* 1, *p.* 38.]

"June 21, 1738. In the House of Represent[ves] Ordered that the Select Men of the Town of Boston be and hereby are fully authorized and impowered to agree with some suitable Person to keep the Hospital, lately built by Order of this Court at Rainsford Island for the reception of sick and infectious Persons; and that the said person be desired and impowered to take all proper care of such persons as may be sent to the said Hospital; and that the said Select Men be impowered to agree with the Person who may take care of the sick &[c] for his time and service therein, by the year.

In Council; Read and Concur'd.

Consented to J. BELCHER."

[*Ibid., p.* 244. See Shurtleff's Historical and Topographical Description of Boston, p. 524 and *seq.*]

From the foregoing it appears that a hospital was built on Rainsford's Island, in the year 1737, "to be used and improved as a public hospital for the reception and accommodation of such sick and infectious persons as shall be sent there by order." It continued until 1749, when the hospital and quarantine grounds were transferred to Deer Island and adjacent thereto. Dr. Shurtleff has the following sketch of this hospital in his Topographical and Historical Description of Boston, pp. 524,525:—

"A Report of a Committee of this Court lately appointed for building an Hospital or Rainsford-Island, showing that they have built an House there of four Rooms on a floor, four upright Chambers and convenient Garrets, and Cellars well-finished and a Well, and suitable Conveniences for the Reception of the Sick, as Occasion may be, dated, Boston, tenth of October, 1737. . . . . The members from the town of Boston were empowered on the nineteenth of December, 1737, to prepare a bill for regulating the public hospital on Rainsford Island, which they presented on the twenty-first of the same month, being an act in addition to the one passed in 1701. This seems to have met with some opposition, as it was not finally passed until the twenty-first[1] of June, 1738. Since then various acts have been passed by the Provincial and State Legislatures on the subject of quarantine; so that Massachusetts may be now regarded as having the best laws on the subject, as well as the best regulated establishment in this country. Until the year 1852[2] when the State adopted a system of State Almshouses, Rainsford Island was used as a quarantine establishment; since then the city of Boston has been obliged to change its quarantine ground, and the new roads for this purpose are situated near Deer Island, the present residence of the Port Physician, the position having been selected at the time of the severe raging of the ship fever, in the summer of 1847.

In 1738–'39 the following act was passed: "An act for regulating the hospital on Rainsford's Island and further providing in case of sickness."

Whereas a good and convenient house hath lately been built, at the charge of the province, on the island called Rainsford Island, for the reception of such persons as shall be visited with any contagious sickness,—

Be it therefore enacted by His Excellency the Governour, Council and Representatives in General Court assembled, and by the authority of the same,

SECTION 1. That the commanding officer at Castle William (having orders therefor from the Captain-general or commander-in-ch[e]i[e]f), and the Keeper of the lighthouse, shall notify and direct the masters of all vessel(l)s coming near them, wherein an infectious sickness is or hath lately been, at their coming in, to come to anchor as near the before-mention(e)d house as may be, that the sick persons, and everything else on board said ship that may give, infection, proper to [be] put into the same house, may be removed into it with the greater ease and safety.

SECT. 2. That upon application made by said master or commander, to two of his majesty's justices of the peace, and the selectmen of the town of Boston, the said justices and selectmen are hereby impowered to permit such passengers, goods or lading as they shall judge free from infection, to come on shoar, or be taken out and disposed of as the owners shall see meet; and such passengers and goods as shall not be permitted as aforesaid, shall remain on board, or be put into the said hospital.

SECT. 3. And if any master or immediate commander of any such vessel[1], for the time being, shall come on sho[a]r[e], or suffer any of his people or passengers to come on sho[a]r[e], or any boats to come on board, or suffer any goods to be taken out of his vessel[l], unless permitted as aforesaid, or shall come up with his vessel[1] until[1], by a certificate under the hands of two justices, and the selectmen [*as*] aforesaid, it shall appear to the captain-general that the said vessel[1], company and goods are clear of infection, and the orders for stopping and detaining the same be removed and taken off, he shall, for every such offence, forfeit the sum of fifty pounds; and in case he be not able to pay that sum, he shall suffer six months' imprisonment. And if any sailors or passengers, coming in said vessel[1], shall, without the knowledge or consent of the master, presume to come on sho[a]r[e], or up above the said castle; or if any person, from town or country, presume to go on board such vessel[1] or go to the aforesaid house or hospital, in time of infection there, without leave from the authority aforesaid; or if any person, put sick into the said house, or sent there on suspicion of being infected, shall presume to go off the island without leave as aforesaid, every person offending in any of the above-mentioned particulars, shall forfeit the sum of ten pounds. And in case any person be not able to pay [*the*] said sum he shall suffer two months' imprisonm[en]t. All the above-mentioned fines to be sued for and recovered by the province treasurer for the time being; one-third of the fines to be to his majesty for the use of this governm[en]t, one-third to the informer, and one-third to the province treasurer for the time being.

SECT. 4. That when and so often as any ship or other vessel[1], wherein any infection or infectious sickness hath lately been, shall come to any port or harbour within this province, or when and so often as any person or persons belonging to, or that may, either by sea or land, come into any town or place near the publick hospital within this province, shall be visited, or who lately before may have been visited, with any infectious sickness, the justices and selectmen of such place be impowered immediately to order the said vessel[1] and sick persons to the province hospital or house aforesaid, there to be taken care of according to the direction of this act.

And when any such ship, vessel[1] or persons cannot, without any great inconvenience and damage, be ordered to the aforesaid house or hospital, in every such case the rules and directions are to be ob-

[1] Should read twenty-nine. See Province Laws, Vol. 2, Chap. 8, p. 944.

[2] This date is erroneous as respects quarantine. It ought to be 1849. See City Record, Vol. 27, pp. 335, 385.

served, which are already made in and by the act pass'd in the thirteenth year of the reign of his late majesty, King William the Third, intitled, "An Act providing in case of sickness."

SECT. 5. And the selectmen of Boston are directed and impowered to provide nurses, assistance and other necessaries for the comfort and rel[e]i[e]f of such sick persons sent to said hospital as aforesaid; the charge thereof to be born[e] by the said persons themselves, if able; or, if poor and indigent, then at the immediate charge of the province.

SECT. 6. This act to continue in force until[1] the end of the session of this court in May, *anno* one thousand seven hundred and forty-three, and no longer.

[*Passed June* 29; *published June* 30.]

In 1743–'44 the following additional section was passed:

"SECT. 5. That if any master, seaman or passenger belonging to any ship on board which any infection is or hath lately been, or is suspected to have lately been, or coming from any port where any infectious mortal distemper prevails, shall refuse to make answer upon oath to such questions as may be asked by the selectmen of the town to which such ship shall come, relating to such infection, such master, seaman or passenger shall forfeit the sum of fifty pounds; and in case he be not able to pay said sum, he shall suffer six months' imprisonment; all the abovementioned fines to be sued for and recovered by the province treasurer for the time being, one third of the fines to be to his majesty, for the use of this governm[en]t, one third to the informer, and one third to the province treasurer for the time being. And when any person shall be convicted of any offence against this act, and suffer the pains of imprisonment, and shall be unable to pay the costs of prosecution, such costs shall be allowed and paid out of the province treasury."

In 1749–'50 slight amendments were made to the act of 1743–'44.

In 1757 an act was passed which was a re-enactment of the act of 1749–'50 with this difference, that there was no limitation.

In section 4 of the acts passed on the 12th August, 1750, and April 4, 1757, no penalty is affixed for their violation. In order to meet this requirement, the following act was passed, 1758:

AN ACT IN ADDITION TO AN ACT INTITLED, "*An Act for regulating the hospital on Rainsfords-island and further providing in case of sickness.*"

Whereas in and by an Act Intitled, "*An act for regulating the Hospital on* Rainsford's Island, *and further providing in Case of Sickness, it is provided, That when and so often as any Ship or other Vessel, wherein any Infection or infectious sickness hath lately been, shall come to any Port or Harbour within this Province, or when and so often as any Person or Persons, belonging to or that may either by Sea or Land, come into any Town or Place near the public Hospital within this Province shall be visited with any infectious Sickness; two of the Justices of the Peace or Select Men of such Place, be and are hereby impowered immediately to order the said vessel and sick Persons to the Province Hospital or House aforesaid to be taken Care of:*

But no Penalty is annexed to the Breach of the afore-recited Paragraph of said Act: Wheretore, BE IT ENACTED BY THE GOVERNOUR COUNCIL AND HOUSE OF REPRESENTATIVES. That when any Ship or other Vessel, wherein any infectious sickness is or hath lately been, shall come to any Port or Harbour in this Province, and either two Justices or the Select-Men of the Place shall order the said Vessel to the Province Hospital; and the Master or Mariners of such Vessel, shall refuse or delay by the Space of six Hours after said Order, given to said Master or either of the Owners of said Vessel, or of the Factors of either of said Owners, to come to fail, if Wind and Weather permit, in order to proceed to said Hospital, the Master of said Vessel shall forfeit and pay the sum of *One Hundred Pounds*, and suffer six Months Imprisonment; one half of said fine to be to the Informer or Prosecentor, and the other half to the Poor of the Town or District, to which such Port or Harbour belongs; the offender to be prosecuted in any Court of Justice proper to try the same.

[See Mass. Perpetual Laws, 1692–1760, Ed. of 1742, and Sup. State Library.]

During the period of the Revolution there was no act passed relating to quarantine. The hospital had suffered damage from the enemy. Accordingly, on June 12, 1780, the following resolve was adopted, appointing the Selectmen of Boston a committee to repair the same:

"*Whereas it has been represented by the Selectmen of the town of* Boston, *and made to appear to this Court, that the State hospital* on Rainsford's *Island has been much damaged by the enemy,* and stands *in need of immediate repair:* Therefore, *Resolved* That the selectmen of the town of *Boston* be, and they are hereby appointed a Committee to make (in the cheapest and most expeditious manner that may be) such repairs at said hospital as they shall judge necessary for the suitable accommodation of the sick, and lay their accounts before the Committee on accounts, for examination, and payment; and they are also impowered to take from Long-Island one or more of the barracks for the purpose of such repairs."

On June 22, 1797, the following act was passed, greatly increasing the power of the selectmen over quarantine.

CHAPTER XVI.

AN ACT TO PREVENT THE SPREADING OF CONTAGIOUS SICKNESS.

SECTION 1. *Be it enacted by the Senate and House of Representatives, in General Court assembled, and by the authority of the same,* That for the better preventing the spreading of infection when it shall happen that any person or persons coming from abroad, or belonging to any town or place within this State, shall be visited, or shall lately before have been visited with the plague, small-pox, pestilential or malignant fever, or other contagious sickness, the infection whereof may probably be communicated to others, the selectmen of the town where such person or persons may arrive, or be, are hereby empowered to take care and make effectual provision in the best way they can for the preservation of the inhabitants, by removing such sick or infected person or persons, and placing him or them in a separate house or houses, and by providing nurses, attendance, and other assistance and necessaries for them, which nurses, attendance and other assistance and necessaries, shall be at the charge of the parties themselves, their parents or masters (if able), or otherwise at the charge of the town or place whereto they belong; and in case such person or persons are not inhabitants of any town or place within this State, then at the charge of the Commonwealth.

SECT. 2. *And be it further enacted,* That any person or persons coming from any place out of the State, where the small pox or other malignant distemper is prevailing, into any town within this State, shall, when thereto required by the selectmen of such town, within the space of two hours from the time they shall be first informed of their duty by law in this particular, give notice to one or more of the selectmen, or the clerk of such town, of their coming there, and of the place from whence they came, upon pain of forfeiting, in case of neglect, the sum of *one hundred dollars.* And such person or persons, if not disabled by sickness, shall, within the space of two hours after warning given to him or them by the selectmen of such town for that purpose, depart from this State, in such manner and by such road, as the said selectmen shall direct; and in case of refusal, it shall be lawful for any Justice of the Peace in the County where such town may lie, by a warrant directed to a constable or other proper officer or other person whom the Justice shall judge proper, to cause such person or persons to be removed into the State from whence he or they may have come; and any person removed by warrant as aforesaid, who, during the prevalence of such distemper, shall presume to return into any town of this State, without liberty first obtained from such justice, shall forfeit and pay the sum of *four hundred dollars;* and any inhabitant of this State, who shall entertain in his house any person warned to depart as aforesaid, for the space of two hours after notice given him of such warning, by one or more of the selectmen aforesaid, shall forfeit or pay the sum of *two hundred dollars.*

SECT. 3. *And be it further enacted,* That it shall and may be lawful for the Selectmen of any town near to, or bordering upon, either of the neighboring States, to appoint by writing under their hands, some meet person or persons to attend at ferries or other places by or over which passengers may pass from such infected places; which person or persons so appointed, shall have power to examine such passengers as they may suspect to bring infection with them, and, if need be, to hinder and restrain them from traveling, until licensed thereto by a Justice of the Peace within such county, or by the selectmen of the town in which such person or persons may come; and any passenger, who coming from such infected place, shall (without license aforesaid) presume to travel within this State, unless it be to return by the most direct way to the State from whence he came, after he shall be cautioned to depart by the person or persons appointed as aforesaid, shall forfeit and pay the sum of *one hundred dollars;* the several forfeitures aforesaid to be recovered by action of debt in any Court of Record proper to try the same, one moiety to and for the use of the town where the offence shall be committed, the other moiety to the use of the person who may sue for the same.

SECT. 4. *And be it further enacted,* That if need be, any two Justices of the Peace may make out a warrant directed to the Sheriff of the County, or his deputy, or Constables of the town or place where any such sick person or persons may be, requiring them or any of them, in the name of the Commonwealth, with the advice and direction of the Selectmen of the same, to remove such infected person or persons, or to impress or take up convenient houses, lodgings, nurses, attendance and other necessaries, for the accommodation, safety and relief of the sick. And such Sheriff, his Deputy and Constable, are hereby authorized and required to execute such warrant accordingly.

SECT. 5. *And be it further enacted,* That whenever there shall be brought into any town within this State, either from any other town therein or from ports without the State, any baggage, cloathing, or goods of any kind whatsoever, and it shall be made to appear by the selectmen of the town to which such baggage, clothing or other goods shall be brought, or by the major part of such selectmen, to the satisfaction of any Justice of the Peace, that there is just cause to suspect baggage, clothing or other goods to be infected with the plague, small pox, pestilential fever or other malignant contagious distemper, it shall be lawful for such justice of the Peace, and he is hereby required in case, by warrant under his hand and seal, directed to the Sheriff, or his Deputy, or any Constable of the town in which such baggage, clothing, or other goods shall be, requiring him to

impress so many men as said Justice shall judge necessary to secure such baggage, clothing, or other goods, and said men to post as a guard and watch over the house or other place or places where such baggage, or clothing shall be lodged; which guard and watch are hereby required to take effectual care to prevent such baggage, clothing, or other goods being removed or intermeddled with, by any persons whatsoever, until due inquiry be made into the circumstances thereof, requiring likewise the said Sheriff, his deputy or the constable aforesaid, if it shall appear necessary, with the advice and direction of said Selectmen, to impress and take up convenient houses or stores, for the receiving, lodging and safe keeping of such baggage, clothing or other goods until the same shall be sufficiently cleansed from infection: And in case it shall appear highly probable to the said Justice, that such baggage, clothing, or other goods are infected as aforesaid, he is hereby empowered and directed to issue his warrant in manner as aforesaid, requiring said Sheriff, his deputy, or any Constable, or other person therein specially named, to remove said baggage, clothing, or other goods to some convenient place where there shall be the least danger of the infection spreading; there to remain, until the same shall be sufficiently aired and freed from infection in the opinion of said Selectmen; and the said Sheriff, Deputy Sheriff, or Constable in the execution of said warrants are empowered and directed, if need be, to break up any house, warehouse, shop or other place, particularly mentioned in said warrant, where such baggage, clothing, or other goods shall be; and in case of opposition, to require such aid as shall be necessary to effect the execution of said warrants, and repel such opposition; and all persons are hereby required at the commandment of either of the said officers, having either of the warrants aforesaid, under penalty of *ten dollars*, to be recovered before any Justice of the Peace in the County where such opposition may happen, to assist such officer in the execution of the same warrant, against any opposition as aforesaid; and the charges of securing such baggage, clothing, or other goods, and of airing or transporting the same, shall be borne and paid by the owners thereof, at such rates and prices as shall be appointed by the Selectmen of the town where such baggage, clothing, or other goods shall be, to be recovered by action of debt, by any person or persons who may have been employed in the business aforesaid, in any Court of Record to try the same.

SECT. 6. *And be it further enacted*, That inquiry shall be made by the officer or other person on duty at the castle in the harbour of *Boston*, of every vessel coming from sea, and passing by the said castle, whether any infectious sickness be on board, or has been on board, since such vessel left the port from whence she last came; and if any such vessel has any sickness on board, or has had any on board, since her leaving such port, in such case, order shall be given by said officer, or other person on duty, to the master or commander of such vessel, immediately to anchor, and to remain at anchor until a certificate shall be obtained from the major part of the selectmen of the town of *Boston*, that they are of opinion such vessel may come up to the town without danger to the inhabitants, or until the said Master or commander shall receive orders from the said Selectmen to anchor his vessel near the Hospital on *Rainsford's Island*, in the harbour of *Boston*. And in case any master or commander of a vessel shall by himself or the people on board, make false answer, when enquired of as aforesaid, by the officer or other person on duty as aforesaid, or after orders are given as aforesaid, shall neglect or or refuse to anchor near the Castle as aforesaid, or come on shore, or suffer any passenger or other person belonging to the vessel to come on shore, or any goods to be taken out before the vessel shall have anchored, or without liberty from the Selectmen as aforesaid; or in case any master or commander of a vessel ordered to anchor near the Hospital as aforesaid, shall neglect or refuse so to do; in every such case, every master or commander so offending, shall forfeit and pay for each offence the sum of *four hundred dollars*, or suffer six months imprisonment.

SECT. 7. *And be it further enacted*, That upon application made to the selectmen of the town of *Boston* by any master or commander of any vessel at anchor near the Hospital as aforesaid, the said selectmen are hereby empowered to permit such passengers, goods, or lading, as they shall judge free from infection to come on shore; or to be taken out and disposed of as the owners shall see fit; and such passengers and goods as shall not be permitted as aforesaid, shall remain on board or be landed on said Island; and if any master or commander of any such vessel, for the time being, shall come on shore, or suffer any of his people or passengers to come on shore, or any boat to come on board, or suffer any goods to be taken out of his vessel, unless permitted as aforesaid, or shall come up to said town, with his vessel, until by a certificate under the hands of said selectmen, or the major part of them, it shall appear that said vessel, company and goods are clear of infection, and the orders for stopping the same be removed or taken off, he shall for every such offence forfeit the sum of *two hundred dollars*; and in case he be not able to pay that sum he shall suffer three months imprisonment; and if any sailors or passengers, coming in said vessel, shall without the knowledge or consent of the master or commander, presume to come on shore, or up above the castle aforesaid, or if any person shall knowingly presume to go on board from shore, or go to the aforesaid House or Island in time of infection there, without leave as aforesaid; or if any person put sick into the said house or sent there on suspicion of being infected shall presume to go off the said Island without leave as aforesaid, any person offending in any of the particulars above mentioned shall forfeit the sum of *two hundred dollars*; and in case such person be not able to pay such forfeiture, he shall suffer two months' imprisonment. All prosecutions for offences contrary to this and the preceding section, shall be by indictment or information in the Supreme Judicial Court or Court of General Sessions of the Peace; and one moiety of all fines mentioned in said sections shall be to the use of the town of *Boston*, and the other moiety to the use of the selectmen of said town for the time being, whose particular duty it is hereby made to prosecute therefor.

SECT. 8. *And be it further enacted*, That whenever any ship or vessel, wherein any infection or infectious sickness hath lately been, shall come to any harbour within this State; or whenever any person or persons belonging to, or that may either by sea or land come into any town or place near the public Hospital aforesaid, shall be visited, or shall lately before have been visited with any infectious sickness, two of the Justices of the Peace or Selectmen of such place be, and hereby are empowered immediately to order the said vessel and sick persons to the said Hospital there to be taken care of according to the directions of this Act: And where any such ship, vessel or persons cannot without great inconvenience and damage be ordered to the aforesaid Hospital, in any such case the rules and directions are to be observed which are provided in the first enacting clause of this Act: And in case the master or mariners of any vessel ordered to the Hospital as aforesaid, shall refuse or delay for the space of six hours after such order being given, to said master or either of the owners of said vessel, or of the factors, or either of said owners of the goods, to come to sail, if wind and weather permit, in order to proceed to said Hospital, such master so refusing shall forfeit and pay the sum of *four hundred dollars*; and each mariner so refusing, the sum of *one hundred dollars*; and in case they be not able to pay said sums, they shall suffer six months' imprisonment; one half of said fine to be to the informer, and the other half to the poor of the town or district, to which such port or harbour belongs, and to be recovered in any Court of Record proper to try the same by indictment or information.

SECT. 9. *And be it further enacted*, That if any master, seaman or passenger, belonging to any vessel on board which any infection is, or may have lately been, or suspected to have been, or which may have come from any port where any infectious mortal distemper prevails, shall refuse to make answer on oath to such questions as may be asked him or them relating to such infection by the Selectmen of the town to which such vessel may come (which oath the Selectmen are hereby empowered to administer), such master, seaman or passenger, so refusing, shall forfeit the sum of *two hundred dollars*; and in case he be not able to pay said sum, he shall suffer six months' imprisonment; said penalty to be adjudged on prosecution by indictment on information in any Court proper to try the same, one moiety of said fine to the use of the town where the offence may be committed, and the other moiety to the use of the Selectmen thereof, whose particular duty it is hereby made to prosecute therefor. And the Selectmen of *Boston* are heraby authorized and directed to provide nurses, assistants, and necessaries, for the comfort and relief of such sick persons as may be sent to said Hospital as aforesaid: The charge thereof to be borne by the said persons themselves, if able, or, if poor and unable, by the towns to which the respectively belong, or, if not inhabitants of any particular town, or other place within this State, then by the Commonwealth.

* * * * * * *

SECT. 12. *And be it further enacted*, That whenever vessels shall arrive at any port other than *Boston* within this Commonwealth, having on board any person visited with the plague, small pox, malignant fever, or any other pestilential disease, the master, commander, or pilot therof shall not bring such vessel up near the town of the port where she first arrives, until liberty be first granted in writing by the Selectmen thereof; but they may bring such vessel to an anchor in such place below the town, as will be most for the safety of the inhabitants thereof and the preservation of the vessel and the people on board, there to wait for orders from the Selectmen of the town before any passenger or person belonging to, or any thing on board the same be brought on shore; and any master or commander of such vessel who shall be found guilty of a breach of the Law contained in this section, shall forfeit and pay a fine of *two hundred dollars* for every such offence, upon conviction thereof before any Court proper to try the same; and any Pilot who may go on board any such vessel, and pilot the same up to the town without liberty first had and obtained from the Selectmen thereof as aforesaid, shall upon conviction, in manner as aforesaid, forfeit and pay a fine of *fifty dollars* for every such offence; all which fines contained in this section may be sued for and recovered with costs of suit in manner as aforesaid by the Selectmen of the town where the offence is committed, to and for the use of the same town.

On June 20, 1799, an act was passed which transferred the power over quarantine to the Board of Health.

* * * * * * *

The first act establishing a board of health in the town of Boston was passed on the 13th February, 1799. This act impowered the board to examine into all nuisances, or if they suspected any cause of disease, could all, or any two of them, with a justice of peace and

sheriff, examine cellars, vessels, &c. It conferred, however, no power on the board to regulate the quarantine of Boston.

On April 17, 1799, a physician (Dr. Welsh) was appointed to act under the direction of the board, his visiting fee not to exceed four dollars. It appears by his warrant, that his duties were, "to examine all such vessels as shall arrive in the Harbour and be detained at the Castle for this purpose,"—"passengers & seamen with their cloaths and Bedding,"—"to give certificate to the Captain" if found free from infection; also, "to certify to the Commanding officer of the Garrison in like manner." If he found any infectious sickness he was "immediately to inform the Board" as well as to "order the vessel to Rainsford Island to land the sick, and have the vessel sufficiently cleansed before coming up to town."

The board next informed the commanding officer of Castle William of Dr. Thomas Welsh's appointment and duties, praying he would assist to carry out the same, and he advised from time to time of such ports as they considered infectious.

In the mean time a vessel arrived from New York having a quantity of feathers on board supposed to be infectious. To prevent this recurrence they solicited the aid of the collector of the port of Boston which would serve to double lock the harbor and prevent any vessel with infection from entering the town. The reply of the collector can be gathered from the minutes of the board, May 15, as follows:—

"That the Collector agreed, that in future no vessells should be admitted to an entry from the West Indies until this Board were satisfied, that the Cargo might be landed without danger to the Inhabitants; and inasmuch as the Coasters took out a general permit the Collector would give special Orders to Inspectors charged with the Coasting Business, not in future to suffer any Feathers, or other suspected goods to be landed until this Board were satisfied that they are free from Infection. The collector further observed the necessity of this Board notifying him on this subject in writing."

It has already been stated that the first act establishing a board of health in the town of Boston gave them no powers over its quarantine.

At a meeting of the board of health held on May 22, 1799, the following vote was passed, showing the necessity felt for the transfer to them of the quarantine power exercised by the Selectmen:

"*Voted*, That Paul Revere, Esq., be a Committee to confer with the Town's Committee, the Representatives of the Town to the General Court of this Commonwealth, or to the Attorney General on the Expediency of altering and amending the Law Entitled, An Act to Empower the Inhabitants of the Town of Boston for choosing a Board of Health, and for removing & preventing Nuisances."

* * * * * * *

SECT. 16. *And be it further enacted*, That all the powers and duties which are given to, and required of the Selectmen of the town of *Boston*, by a certain law of this Commonwealth, passed the twenty-second day of *June*, one thousand seven hundred and ninety-seven, entitled "An act to prevent the spreading of contagious sickness," shall be, and they are hereby transferred to, and made the duty of the Board of Health of the town of *Boston*, anything in said law to the contrary notwithstanding.

SECT. 17. *And be it further enacted*, That the Board of Health, for the town of *Boston*, shall, and they hereby are empowered from time to time, to choose a suitable and discreet person, who has been approved of by some Medical Society within this Commonwealth, to act as a visiting Physician to said Board, whose duty it shall be, to visit all vessels coming from any place or places, in which the said Board shall think that any contagious sickness prevails, and such Physician shall be under the directions of said Board, and may be removed by them whenever they shall see cause.

* * * * * * *

An additional act was passed June 20, 1816, entitled: "An act to empower the town of Boston to choose a board of health and to prescribe their power and duty." It recites the time of choosing members, the powers of the clerk, powers of the president, regulations and powers of the board, and provides for its supervision over quarantine.

* * * * * *

SECT. 6. *Be it further enacted*, That the said Board of Health, shall have power to establish and regulate the quarantine to be performed by all vessels arriving within the harbor of Boston, and for that purpose shall have power from time to time to establish, make and ordain all such orders, rules, and regulations relating to said quarantine, as said Board shall think necessary for the safety of the public and the security of the health of the inhabitants of the said town of Boston;

* * * * * * *

It appears from this review that the early jurisdiction over quarantine was exercised by the governor and council of the Colony of Massachusetts Bay. Later it was carried out by the same, with the assistance of the selectmen of the town of Boston. These selectmen had the full powers over quarantine conferred on them by an act passed in the year 1797. By the appointment of a board of health in 1799, all the powers of the selectmen over quarantine were delegated to this board by an act passed 20th June, 1799, and continued until the board ceased to exist.

By the seventeenth section of the act of 1821, establishing the City of Boston, all the power and authority by law invested in the Board of Health for the town of Boston, at the time of the passage of the said act, relative to the quarantine of vessels, and relative to every other subject whatsoever, was transferred to and vested in the City Council, to be carried into execution by the appointment of Health Commissioners, or in such other manner as the health, cleanliness, comfort and order of the said city might in their judgment require, subject to such alterations as the legislature might from time to time adopt. (See City Ordinances, 1856, page 242.)

By a resolve of the legislature passed February 4, 1832, the governor was authorized to appoint three commissioners to revise the General Statutes of this Commonwealth. This body of laws compiled by the commissioners, and known as the Revised Statutes of the Commonwealth of Massachusetts, was passed November 4, 1835. Another act was passed on the same date, repealing all previous statutes therein revised and consolidated.

In the Revised Statutes, the act on the subject of quarantine can be found in Chapter 21, commencing with section 27. In substance, this act is the same as that passed in the year 1816.

Gallop's Island was purchased by the city of Boston in 1866. The War Department had erected on it a number of buildings, which were occupied by United States troops. The civil war had ended, the United States authorities had no further use for the buildings, and in view of the approach of cholera these buildings would be highly serviceable to the city. Negotiations were entered into, and the sum of five thousand dollars appropriated for the purchase of the buildings and furniture.

The location of quarantine had been changed from Rainsford Island (Nantasket Road), into the road at Deer Island, in the year 1849. The first officer acting under the title of port physician was chosen August 20, 1850, by concurrent vote of both branches of the city council.

The present quarantine ground is, as has before been stated, near Deer Island. In view of the possibility of the occurrence of malignant cholera, the city, in the spring of 1866, purchased the buildings erected on Gallop's Island, the United States Government no longer requiring them for military purposes, and passed an ordinance on the first day of June, 1866, extending the quarantine grounds so as to include Gallop's Island.

The quarantine hospital, as established on Deer Island in 1849, remained there until April, 1867. At this time small-pox was prevailing in the city to a considerable extent, and the greater number of cases requiring to be removed were sent down to quarantine hospital. The accommodations at Deer Island soon became inadequate, and in April of that year, for the purpose of providing larger hospitals and the better isolation of contagious diseases in quarantine, several buildings on Gallop's Island were temporarily fitted up, and the patients in the old hospital at Deer Island removed thereto. The Deer Island hospital was then abandoned. From time to time the old buildings at Gallop's Island were enlarged and improved, as the demand for their use increased, until during the epidemic of small-pox in the winter of 1872–73, when at one time they contained over one hundred patients.

During the epidemic referred to the present board of health was created and given all the authority before vested in the mayor and aldermen or city council as a board of health.

This board at once established an inland hospital for small-pox, since which no cases have been sent from the city to quarantine. All the old buildings on the island have since been removed and new ones have taken their places. There are two commodious hospitals, one for small-pox and the other for fever patients. These, with an ample supply of hospital tents now on hand, are sufficient for any emergency likely to arise.

The island has been greatly improved in the last few years, and provided with suitable buildings and appurtenances of every kind for the keeper, and for the proper maintenance of a quarantine establishment. The boarding station is still at Deer Island, where it has been since 1849. It is provided with a steam propeller for the use of the port physician and his assistant in boarding vessels and transferring the sick from vessels to the quarantine hospitals.

PRESENT STATUTES CONCERNING QUARANTINE IN THE STATE OF MASSACHUSETTS.

32. A town may establish a quarantine ground in a suitable place either within or without its own limits; but if such place is without its limits, the assent of the town within whose limits it may be established shall be first obtained.

33. Two or more towns may at their joint expense establish a quarantine ground for their common use, in any suitable place either within or without their own limits; but if such place is without their limits, they shall first obtain the assent of the town within whose limits it may be.

34. The board of health in each seaport town may from time to time establish the quarantine to be performed by vessels arriving within its harbor; and may make such quarantine regulations as it judges necessary for the health and safety of the inhabitants.

Whenever quarantine is imposed on any vessel coming from abroad, and the owner, consignee, master, or other person interested in such vessel or her cargo, shall be interrogated by any member of the board of health in his official capacity, or by the visiting physician

of said board, respecting any circumstance or event touching the health of the crew or passengers on such vessel, or any infection suspected in the cargo, from the time of her first engaging on the voyage she may then be terminating, and the said owner, consignee, master, or other person interested as aforesaid, shall make any false or unfounded declaration respecting the points under examination, every such owner, consignee, master, or other interested person, upon conviction thereof, in manner as pointed out in the eighth section of the law to which this is an addition, shall forfeit and pay a fine not exceeding five hundred dollars, suffer the six months' imprisonment, either or both, at the discretion of the court having cognizance of such offence.

35. Such regulations shall extend to all persons, goods, and effects arriving in such vessels, and to all persons who may visit or go on board of the same.

36. Whoever violates any such regulation, after notice thereof has been given in the manner before provided in this chapter, shall forfeit a sum not less than five nor more than five hundred dollars.

37. The board in each seaport town may at all times cause a vessel arriving in such port, when such vessel or the cargo thereof is in his opinion foul or infected, so as to endanger the public health, to be removed to the quarantine ground, and thoroughly purified at the expense of the owners, consignees, or persons in possession of the same; and may cause all persons arriving in or going on board of such vessel, or handling the cargo, to be removed to any hospital under the care of the board, there to remain under their orders.

38. If a master, seaman, or passenger belonging to a vessel on board of which any infection then is or has lately been, or is suspected to have been, or which has been at, or has come from, a port where infectious distemper prevails that may endanger the public health, refuses to make answer on oath to such questions as may be asked him relating to such infection or distemper by the board of health of the town to which such vessel may come (which oath any member of the board may administer), such master, seaman, or passenger shall forfeit a sum not exceeding two hundred dollars; and if not able to pay said sum, he shall suffer six months' imprisonment.

39. All expenses incurred on account of any person, vessel, or goods, under quarantine regulations, shall be paid by such persons, or the owner of such vessel or goods respectively.

THE PRESENT ORDINANCES RELATING TO QUARANTINE AT BOSTON.

SECT. 23. The quarantine grounds of the city of Boston shall consist of Deer Island and Gallop's Island, in Boston Harbor; and said islands are hereby made and declared to be the places of quarantine for the port of Boston.

SECT. 24. The said board of health shall annually, in the month of April, appoint, subject to the approval of the mayor, a suitable person for port physician, who shall hold his office for one year from the first Monday in May in the year in which he is appointed, unless sooner removed; and he may be removed at the pleasure of the board, and a vacancy may be filled at any time for the unexpired term. He shall perform such duties in addition to those hereinafter designated, keep such records, and make such reports, as the board of health may from time to time direct. For his services he shall receive such compensation as the city council may from time to time determine.

SECT. 25. The port physician shall reside at Deer Island. He shall be superintendent and physician of the quarantine establishment at Deer Island, and either physician or assistant physician, as the board of directors for public institutions may elect, of all the city establishments which are, or may be, located upon said island. He shall also perform all such services as may be required of him by the mayor, or the board of health, in relation to quarantine.

SECT. 26. The port physician may, at any time, with the concurrence of the board of health, appoint an assistant port physician, to hold his office so long as the board of health shall determine; and such port physician shall receive such compensation for his services as may be appropriated therefor by the city council.

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—United States Consul B. Getrish reports for the month of April the following mortality: From small-pox, 11; typhoid fever, 6; other contagious diseases, 28; apoplexy, 20; consumption, 67; acute lung diseases, 23; croup, 11. There were 378 deaths from all causes; annual death rate, 21.4 per 1,000, the population being estimated at 215,140.

CONSTANTINOPLE.—United States Consul G. H. Heap forwards copies of telegrams from which the following extracts are made:

1. The sanitary council of Egypt, at a meeting on April 5, passed the following resolutions:

The council, considering that Syria is not infected by the plague and that vigorous measures have been used for its restriction on the frontier by the Ottoman Government, decides to modify the prohibitions heretofore issued with regard to importations from Syria as follows:

a. Passengers from Syrian ports in ships with clean bills of health will be admitted to free pratique in Egypt after a strict medical inspection and disinfection of their baggage within 24 hours after arrival.

b. Merchandise not susceptible of retaining infection may be landed in Egypt, comprising manufactured goods in bales, excepting carpets and shawls. The coverings of such packages will be aired and disinfected. But all goods coming from Syria, with a certificate from the proper authorities that the goods are not from an infected region, will be admitted without inspection into Egypt, except paper stock, rags, and cast-off clothing.

c. Any vessel which has retained on board articles susceptible of infection will not be admitted to pratique, and a note to that effect will be made on her papers.

The loading, unloading, and transshipping of goods shall be done in quarantine, and those engaged in these operations shall be subjected to the prescribed measures of disinfection.

2. Dr. Obermayer reports that the following damage has been done by the earthquakes of April 22 and 30 on the coast of Asia Minor, opposite to the island of Chios. Seven villages, containing a total of 31,455 inhabitants, had 47 killed and 117 wounded; houses destroyed, 2,663; houses damaged, 2,706.

3. *April* 26.—Dr. Zitterer reports two more villages burnt and the people put into camps. He gives details of operations at several points, and states that medical inspectors have been notified to send no reports of the plague from any other source of information than their personal inspection. At Nedjeff 54 deaths were reported for April 20 and 76 for April 21. At Djaraa, 23 deaths April 18; April 20, deaths 21, and April 21, deaths 19. Telegrams of April 27 indicate no abatement of the epidemic.

RIO DE JANEIRO.—United States Consul T. Adamson forwards with his report of mortality for the week ending April 2, a record of meteorological observations for the first three months of this year. Yellow fever is steadily decreasing, and only 6 deaths are reported for the week. Out of a total of 201 deaths, consumption gives 24, or about 12 per cent., which is less than the mean rate for the United States.

SAINT JOHN'S, NEWFOUNDLAND.—Under date of May 18, United States Consul T. N. Molloy states that the Government of Newfoundland, having been informed that fever and small-pox exist at New York and other ports of the United States, has ordered that all vessels from those ports, under 14 days of passage, shall be subjected to quarantine until examined by the proper authorities of the port of Saint John's.

SMYRNA.—From this port, United States Consul B. O. Duncan writes, under date of April 21, that the caravans from Nedjeff to Damascus and Aleppo are much more likely to carry the plague into Asia Minor than any communication by sea. No decrease of the pest is hoped for until the heat of summer, about the end of May, a high temperature being regarded as unfavorable to the spread of the disease. The items of news, to the date of this letter, have been already given in the dispatches from Constantinople.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BROWNSVILLE, TEX.—Dr. J. M. Main, under date of May 10, forwards report of deaths for April, 1881. Among the causes noted are: Consumption 4, small-pox 4, old age 1. Total deaths, 9; population, 5,800; annual death-rate 18.8 per 1,000.

NEW ORLEANS, LA.—At the regular meeting of the New Orleans Medical and Surgical Association, held May 7, a committee of six members was appointed to prepare a resolution to be addressed to the National Board of Health and to the Louisiana State board of health which, when submitted, was unanimously adopted, as follows:

Resolved, That the special attention of the National Board of Health be called to the unusual prevalence at the present time of typhus fever, scarlet fever, small-pox, and other contagious diseases in the Northern and in some of the Western States. We, therefore, urge the necessity of immediate action, the most rigid railroad inspection from such places, believing, as we do, that they may be considered *dangerously infected*.

J. P. DAVIDSON, M. D.,
D. C. HOLLIDAY, M. D.,
M. LEVY, M. D.,
J. L. CRAWCOUR, M. D.,
G. K. PRATT, M. D.,
D. JAMESON, M. D.,
Committee.

M. LEVY, M. D., *Secretary.*

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

HAVANA, CUBA.—For the week ending May 13, there are reported 2 deaths from yellow fever, 12 from typhoid fever, and 33 from small-pox. No contagious disease was known to exist among the merchant shipping.

MERIDIAN, MISS., May 12.—The local board of health has organized, with the following officers: A. H. Smith, M. D., president; M. L. Lowry, M. D., health officer; J. H. Blanks, M. D., secretary; R. V. Love and W. A. Brown, members.

THE NATIONAL BOARD OF HEALTH.

OFFICERS.

JAMES L. CABELL, LL. D., &c.....*President.*
JOHN S. BILLINGS, Surgeon United States Army.....*Vice-President.*
THOMAS J. TURNER, Medical Director United States Navy.....*Secretary.*

MEMBERS.

PRESTON H. BAILHACHE, M. D., U. S. M. H. S., 509 Maple ave., Le Droit Park, Washington, D. C.
SAMUEL M. BEMISS, M. D., &c., 558 Saint Charles street, New Orleans, La.
JOHN S. BILLINGS, M. D., United States Army, 84 Gay street, Georgetown, D. C.
JAMES L. CABELL, M. D., &c., University of Virginia, Va.
CHARLES F. FOLSOM, M. D., &c., 113 Boylston street, Boston, Mass.
HOSMER A. JOHNSON, M. D., &c., 4 Sixteenth street, Chicago, Ill.
ROBERT W. MITCHELL, M. D., &c., 34 Madison street, Memphis, Tenn.
SAMUEL F. PHILLIPS, esq., Solicitor General, 1119 K street, Washington, D. C.
STEPHEN SMITH, M. D., &c., 31 West Forty-second street, New York.
THOMAS J. TURNER, M. D., U. S. N., 1227 M street, N. W., Washington, D. C.
TULIO S. VERDI, M. D., &c. 815 Fourteenth street, N. W., Washington, D. C.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

Total population, 300,888; deaths under 5 years, 51; total number of deaths, 126; annual rate per 1,000, 21.8.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JUNE 4, 1881. [No. 49.

ANNUAL MEETING OF THE NATIONAL BOARD OF HEALTH.

The annual meeting of the National Board of Health was held in the city of Washington, D. C., convening on June 1 and adjourning June 2, 1881.

The Board re elected its former officers.

BY-LAWS OF THE NATIONAL BOARD OF HEALTH.

1st. The officers of the National Board of Health shall consist of a president, vice-president, and secretary.

2d. There shall be an executive committee, composed of the president, vice-president, secretary, and three other members.

3d. The officers of the Board and the other members of the executive committee shall be elected by ballot at the first annual meeting in each year, the nomination to be by informal ballot.

4th. The duties of the president shall be—

First. To preside at all meetings of the Board and of the executive committee.

Second. To call meetings as provided in the act creating the Board.

Third. To make requisitions upon the Secretary of the Treasury for such sums as may be directed by the Board.

5th. The vice-president shall take the place and perform the duties of the president when absent.

6th. The secretary shall keep the records and conduct the correspondence of the Board and of the executive committee, certify to the correctness of all vouchers for expenditures, and perform such other duties as the Board or executive committee may from time to time direct, and he shall be the custodian of all papers, books, and other property of the Board.

7th. The executive committee shall carry into effect the directions of the Board, and act for it during the intervals of its sessions, reporting such action to the next meeting.

8th. The executive committee is authorized to fill any vacancies in the offices or executive committee occurring in the intervals of the meetings of the Board, such election to hold good until the close of the next meeting of the Board.

9th. No purchases shall be made or expenditures incurred except by order of the Board or of the executive committee, and the executive committee shall not have power to incur any indebtedness beyond the amount of funds authorized by the Board to be drawn by the president and placed to the credit of the Board with its disbursing agent.

10th. The executive committee shall be considered to be in permanent session, and, in the interval of the regular meetings, any three members, of whom the secretary shall be one, shall constitute a quorum, and be authorized to transact any business, provided there be a concurrent vote. In case of disagreements the secretary shall be required to report the fact to the absent members and solicit an expression of their wishes as to the call of a formal meeting of the whole committee, or as to taking a vote by correspondence.

11th. All bills for salaries and expenses shall be duly certified by a member or inspector of the Board, and audited and approved by the secretary of the Board, who shall keep an accurate record of such vouchers and approvals.

12th. The standing committees of the Board shall be as follows, each to be composed of not less than three members, named by the president, with the exception of that on epidemic and contagious diseases, which shall consist of five members:

1. On epidemic and contagious diseases.
2. On registration and vital statistics.
3. On State, municipal, and local sanitary legislation.
4. On quarantine legislation—State, national, and international.

13th. The regular meetings of the Board shall be semi-annual, in June and December of each year, at a day and place to be fixed by the executive committee.

14th. The president shall call a meeting of the Board whenever five members make in writing or by telegraph a joint request to him to that effect.

LAWS RELATING TO THE NATIONAL BOARD OF HEALTH.

Constituting act.

AN ACT to prevent the introduction of infections or contagious diseases into the United States, and to establish a National Board of Health.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there shall be established a National Board of Health to consist of seven members, to be appointed by the President, by and with the advice and consent of the Senate, not more than one of whom shall be appointed from any one State, whose compensation, during the time when actually engaged in the performance of their duties under this act, shall be ten dollars per diem each and reasonable expenses, and of one medical officer of the Army, one medical officer of the Navy, one medical officer of the Marine Hospital Service, and one officer from the Department of Justice, to be detailed by the Secretaries of the several departments and the Attorney General, respectively, and the officers so detailed shall receive no compensation. Said board shall meet in Washington within thirty days after the passage of this act and in Washington or elsewhere from time to time upon notice from the president of the board, who is to be chosen by the members thereof, or upon its own adjournments, and shall frame all rules and regulations authorized or required by this act, and shall make or cause to be made such special examinations and investigations at any place or places within the United States, or at foreign ports, as they may deem best, to aid in the execution of this act and the promotion of its objects.

SEC. 2. The duties of the National Board of Health shall be to obtain information upon all matters affecting the public health, to advise the several departments of the government, the executives of the several States, and the Commissioners of the District of Columbia, on all questions submitted by them, or whenever in the opinion of the board such advice may tend to the preservation and improvement of the public health.

SEC. 3. That the Board of Health with the assistance of the Academy of Science, which is hereby requested and directed to co-operate with them for that purpose, shall report to Congress at its next session a full statement of its transactions, together with a plan for a national public health organization, which plan shall be prepared after consultation with the principal sanitary organizations and the sanitarians of the several States of the United States, special attention being given to the subject of quarantine, both maritime and inland, and especially as to regulations which should be established between State or local systems of quarantine and a national quarantine system.

SEC. 4. The sum of fifty thousand dollars, or so much thereof as may be necessary, is hereby appropriated to pay the salaries and expenses of said board and to carry out the purposes of this act.

Approved, March 3, 1879.

AN ACT to prevent the introduction of contagious or infectious diseases into the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That it shall be unlawful for any merchant ship or vessel from any foreign port where any contagious or infectious disease exists, to enter any port of the United States except in accordance with the provisions of this act, and all rules and regulations of State boards of health and all rules and regulations made in pursuance of this act; and any such vessel which shall enter, or attempt to enter, a port of the United States, in violation thereof, shall forfeit to the United States a sum, to be awarded in the discretion of the court, not exceeding one thousand dollars, which shall be a lien upon said vessel, to be recovered by proceedings in the proper district court of the United States. And in all such proceedings the United States district attorney for such district shall appear on behalf of the United States, and all such proceedings shall be conducted in accordance with the rules and laws governing cases of seizure of vessels for violation of the revenue laws of the United States.

SEC. 2. All such vessels shall be required to obtain from the consul, vice-consul, or other consular officer of the United States at the port of departure, or from the medical officer, where such officer has been detailed by the President for that purpose, a certificate in duplicate setting forth the sanitary history of said vessel, and that it has in all respects complied with the rules and regulations in such cases prescribed for securing the best sanitary condition of the said vessel, its cargo, passengers, and crew; and said consular or medical officer is required, before granting such certificate, to be satisfied the matters and things therein stated are true; and for his services in that behalf he shall be entitled to demand and receive such fees as shall by lawful regulation be allowed, to be accounted for as is required in other cases.

That upon the request of the National Board of Health the President is authorized to detail a medical officer to serve in the office of the consul at any foreign port for the purpose of making the inspection and giving the certificates hereinbefore mentioned: *Provided*, That the number of officers so detailed shall not exceed at any one time six: *Provided further*, That any vessel sailing from any such port without such certificate of said medical officer, entering any port of the United States, shall forfeit to the United States the sum of five hundred dollars, which shall be a lien on the same to be recovered by proceedings in the proper district court of the United States. And in all such proceedings the United States district attorney for such district shall appear on behalf of the United States, and all such proceedings shall be conducted in accordance with the rules and laws governing cases of seizure of vessels for violation of the revenue laws of the United States.

SEC. 3. That the National Board of Health shall co-operate with and, so far as it lawfully may, aid State and municipal boards of health in the execution and enforcement of the rules and regulations of such boards to prevent the introduction of contagious or infectious diseases into the United States from foreign countries, and into one State from another; and at such ports and places within the United States as have no quarantine regulations under State authority where such regulations are, in the opinion of the National Board of Health, necessary to prevent the introduction of contagious or infectious diseases into the United States from foreign countries, or into one State from another; and at such ports and places within the United States where quarantine regulations exist under the authority of the State, which, in the opinion of the National Board of Health, are not sufficient to prevent the introduction of such diseases into the United States, or into one State from another, the National Board of Health shall report the facts to the President of the United States, who shall, if, in his judgment, it is necessary and proper, order said Board of Health to make such additional rules and regulations as are necessary to prevent the introduction of such diseases into the United States from foreign countries, or into one State from another, which, when so made and approved by the President, shall be promulgated by the National Board of Health, and enforced by the sanitary authorities of the States, where the State authorities will undertake to execute and enforce them; but if the State authorities shall fail or refuse to enforce said rules and regulations the President may detail an officer or appoint a proper person for that purpose.

The Board of Health shall make such rules and regulations as are authorized by the laws of the United States and necessary to be observed by vessels at the port of departure and on the voyage where such vessels sail from any foreign port or place at which contagious or infectious disease exists, to any port or place in the United States, to secure the best sanitary condition of such vessel, her cargo, passengers, and crew, and when said rules and regulations have been approved by the President they shall be published and communicated to, and enforced by, the consular officers of the United States: *Provided*, That none of the penalties herein imposed shall attach to any vessel or any owner or officer thereof, till the act and the rules and regulations made in pursuance thereof shall have been officially promulgated for at least ten days in the port from which said vessel sailed.

SEC. 4. It shall be the duty of the National Board of Health to obtain information of the sanitary condition of foreign ports and places from which contagious and infectious diseases are or may be imported into the United States, and to this end the consular officers of the United States at such ports and places as shall be designated by the National Board of Health shall make to said Board of Health weekly reports of the sanitary condition of the ports and places at which they are respectively stationed, according to such forms as said Board of Health may prescribe; and the Board of Health shall also obtain, through all sources accessible, including State and municipal sanitary authorities throughout the United States, weekly reports of the sanitary condition of ports and places within the United States; and shall prepare, publish, and transmit to the medical officers of the Marine Hospital Service, to collectors of customs, and to State and municipal health officers and authorities, weekly abstracts of the consular sanitary reports and other pertinent information received by said board; and shall also, as far as it may be able, by means of the voluntary co-operation of State and municipal authorities, of public associations and private persons, procure information relating to the climatic and other conditions affecting the public health; and shall make to the Secretary of the Treasury an annual report of its operations, for transmission to Congress, with such recommendations as it may deem important to the public interests; and said report, if ordered to be printed by Congress, shall be done under the direction of the board.

SEC. 5. That the National Board of Health shall from time to time issue to the consular officers of the United States and to the medical officers serving at any foreign port, and otherwise make publicly known, the rules and regulations made by it and approved by the President, to be used and complied with by vessels in foreign ports for securing the best sanitary condition of such vessels, their cargoes, passengers, and crews, before their departure for any port in the United States, and in the course of the voyage, and all such other rules and regulations as shall be observed in the inspection of the same on the arrival thereof at any quarantine station at the port of destination, and for the disinfection and isolation of the same, and the treatment of cargo and persons on board, so as to prevent the introduction of cholera, yellow fever, or other contagious or infectious diseases; and it shall not be lawful for any vessel to enter said port to discharge its cargo or land its passengers except upon a certificate of the health officer at such quarantine station, certifying that said rules and regulations have in all respects been observed and complied with, as well on his part as on the part of the said vessel and its master, in respect to the same and to its cargo, passengers, and crew; and the master of every such vessel shall produce and deliver to the collector of customs at said port of entry, together with the other papers of the vessel, the said certificates required to be obtained at the port of departure and the certificate herein required to be obtained from the health officer at the port of entry.

SEC. 6. That to pay the necessary expenses of placing vessels in proper sanitary condition, to be incurred under the provisions of this act, the Secretary of the Treasury be, and he hereby is, authorized and required to make the necessary rules and regulations fixing the amount of fees to be paid by vessels for such service, and the manner of collecting the same.

SEC. 7. That the President is authorized, when requested by the National Board of Health, and when the same can be done without prejudice to the public service, to detail officers from the several departments of the government, for temporary duty, to act under the direction of said board, to carry out the provisions of this act; and such officers shall receive no additional compensation except for actual and necessary expenses incurred in the performance of such duties.

SEC. 8. That to meet the expenses to be incurred in carrying out the provisions of this act, the sum of five hundred thousand dollars, or so much thereof as may be necessary, is hereby appropriated, to be disbursed under the direction of the Secretary of the Treasury on estimates to be made by the National Board of Health, and to be approved by him. Said National Board of Health shall as often as quarterly make a full statement of its operations and expenditures under this act to the Secretary of the Treasury, who shall report the same to Congress.

SEC. 9. That so much of the act entitled "An act to prevent the introduction of contagious or infectious diseases into the United States", approved April twenty-ninth, eighteen hundred and seventy-eight, as requires consular officers or other representatives of the United States at foreign ports to report the sanitary condition of and the departure of vessels from such ports to the Supervising Surgeon-General of the Marine Hospital Service, and so much of said act as requires the Surgeon-General of the Marine Hospital Service to frame rules and regulations, and to execute said act, and to give notice to Federal and State officers of the approach of infected vessels, and furnish said officers with weekly abstracts of consular sanitary reports, and all other acts and parts of acts inconsistent with the provisions of this act be, and the same are hereby, repealed.

SEC. 10. This act shall not continue in force for a longer period than four years from the date of its approval.

Approved, June 2, 1879.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

ABSTRACTS FROM CONSULAR REPORTS.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys reports no contagious diseases during the month of March. There were 62 deaths, in a population of 20,000, in Bridgetown, giving an annual death-rate of 36.5 per 1,000. Mean temperature, 82°.

BARBADOES, WEST INDIES.—United States Consul W. H. Polleys has received a note from the local authorities, under date of April 30, stating that three cases of yellow fever have recently occurred, two of which were fatal. But, after careful inquiry, the board of health has decided that there is no reason to suspend the issue of clean bills of health to vessels, and the consul is satisfied that all due precautions are taken to prevent the spread of the disease.

BUENOS AYRES.—The report of United States Consul E. L. Baker for the month of March gives only one death from small-pox; there were 25 from typhoid fever and 12 from diphtheria. The total mortality was 466 in a population of 270,000, being at an annual rate of 20.3 per 1,000. Mean temperature, 72°. The quarantine against Rio de Janeiro still continues.

CHINESE PORTS.—Reports from Amoy and Foochow to March 26 state that those ports continue free from contagious diseases. Advices from Ningpo to April 9 report some small-pox, which usually prevails at this season, from the practice of inoculation.

GUADALOUPE.—United States Consul C. Bartlett reports 9 cases of yellow fever, with 5 deaths, for the week ending April 16. General sanitary condition of Pointe à Pitre not satisfactory.

MALTA AND GOZO.—U. S. Consul C. B. Eynaud reports for the four weeks ending April 15, 4 deaths from typhoid fever. Deaths from all causes, 313; population, 154,830; annual death-rate, 26.3 per 1,000.

MARACAIBO, VENEZUELA.—United States Consul E. H. Plumacher sends reports for March and April, showing that no statistics of mortality can be obtained. Yellow fever may be considered endemic, but does not generally prevail to any alarming extent, nor in severe form. The draining and cleaning of the town are very defective.

SANDWICH ISLANDS.—United States Consul D. A. McKinly reports, under date of May 4, that in Honolulu small-pox still prevails, and caused 77 deaths, out of a total of 128, in the month of April. No other contagious disease is noted.

SANTIAGO DE CUBA.—For the month of April United States Consul J. C. Landreau reports 4 deaths from yellow fever, 3 from small-pox, and 14 cases of typhoid fever, with 7 deaths. The yellow fever was confined to the Spanish troops, and the port continues free of disease, so that clean bills of health are issued. Total mortality for the month, 92; population, 40,000; annual death-rate, 28.0 per 1,000.

SINGAPORE.—United States Consul A. G. Studer reports this district free from epidemic or contagious diseases up to April 4.

ST. THOMAS, WEST INDIES.—United States Consul Victor Thompson reports, under date of April 22, that a body of stagnant water, surrounded by marshes, about a mile inland from the bay, has become very offensive. This is regarded as the source of malarial fevers and other diseases now prevailing. The crowding of the black population in the filthy alleys of the town also contributes to the unsanitary condition of the port. No yellow fever is reported.

VERA CRUZ, MEXICO, April 24.—United States Consul S. T. Trowbridge reports 5 deaths among soldiers recently arrived from the interior. Small-pox has disappeared, and there is no reason at present for detaining healthy vessels in quarantine.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

MONTHLY REPORT OF MORTALITY IN CITIES OF THE UNITED STATES.

Cities and States.	Month.	Population.	Deaths under 5 years.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Cerebro-spinal meningitis.	Consumption.	Croup.	Diarrhœal diseases. SANITARY LEGISLATION IN FLORIDA.

An act to provide for the appointment of boards of health for incorporated cities and towns in this State containing three hundred or more registered voters.

The people of the State of Florida represented in the Senate and Assembly do enact as follows:

SECTION 1. The governor of the State of Florida shall appoint for every incorporated city and town in this State containing three hundred or more registered voters, a board of health, consisting of five discreet persons, not less than two of whom shall be medical men of acknowledged skill and experience, to serve without pay. All vacancies occurring shall be filled by appointment made by the governor.

SEC. 2. The mayor of the city or town and the chairman of the board of county commissioners shall be *ex-officio* members of said boards.

SEC. 3. Said boards of health shall be appointed for the term of four years, and a majority of the members shall constitute a quorum for the transaction of business.

SEC. 4. Said boards of health as thus created shall have full power to act in regard to all matters pertaining to the public health and vital statistics, and are empowered to make such rules and regulations as they may deem necessary for their government and the protection of the public health, abatement of nuisances, &c., and the jurisdiction of each board of health shall extend to the boundaries of the county in which it is located; and in case there be more than one such board in any county the jurisdiction of each shall extend to a line midway between them.

SEC. 5. In all matters of quarantine said boards of health shall have the same powers as are conferred upon boards of health in the provisions of an act entitled "An act to provide a uniform system of quarantine in this State," approved March 11, 1879.

SEC. 6. This act shall in no wise be construed as repealing section 1 of an act entitled "An act to provide a uniform system of quarantine in this State," approved March 11, 1879, so far as it relates to cities and towns of less than three hundred registered voters.

Approved March 7, 1881.

A true copy of the original statute.

[SEAL.] J. S. LEONARD, *N. Public.*

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

ATLANTA, GA.—In reply to an inquiry concerning certain reports in the newspapers of epidemic disease in the city of Atlanta, Dr. J. B. Baird, health officer, makes the following statements, under date of May 26:

The alarm which led to the reports of an epidemic of scarlet fever, and a possible case of yellow fever, was caused by the following circumstances: On May 9 a lady and two of her children became suddenly ill, the symptoms being sore throat, vomiting, purging, and a cutaneous efflorescence. They all died within forty-eight hours. Two or three days after, the third and last child in the family was similarly attacked, and died in a few days. It was thought by the attending physician, and by some of those consulting, that the disease was scarlet fever, but one of the latter attributed the deaths to poisoning from impure well-water. The publication of these deaths, more or less embellished and presented in a sensational manner, gave rise to the reports of an epidemic of scarlet fever. No other cases occurred, and the panic among the citizens soon subsided. Even a sporadic case of scarlet fever is rarely reported in Atlanta, and the disease is not known to have existed at any time as an epidemic. Only three or four deaths from this cause are recorded within the past year.

As to the rumor of a possible case of yellow fever in Atlanta, it can only be said that it is absolutely without foundation. No case of that disease was ever developed in Atlanta, nor did it ever spread from those who were affected with yellow fever after seeking refuge here during the epidemic of 1878. In previous epidemics, also, people from infected districts have died of yellow fever in Atlanta, but the disease has never been known to extend even to those in attendance upon the sick. During these epidemics no quarantine precautions were taken.

The report of Dr. Baird is supported by official statements from the president of the city board of health and from the superintendent of public schools, showing that there has been no ground whatever for any report of epidemic or contagious disease in Atlanta.

HAVANA, CUBA.—For the week ending May 20 there are reported 3 deaths from yellow fever, 32 from small-pox, and 11 from typhoid fever. The British bark *Ada Barton* sailed for Ship Island about May 16, leaving her captain in hospital with small-pox. He was taken sick May 12, on board of his vessel, and was removed May 14, when the crew were vaccinated and the vessel disinfected. No yellow fever is reported among the shipping.

POISONOUS COLORING OF TOYS.

M. L. de Geoffroy, chargé d'affaires, informs the Government of the United States, under date of May 18, that the French Government has taken decided measures to prevent the manufacture, importation, or exportation of toys colored with poisonous pigments. These measures apply to toys manufactured in foreign countries, as well as to those of French manufacture. The custom-house officers of France have been instructed to allow no such articles to pass the frontier, and this notice is given in order that American shippers may not order goods subject to seizure.

The following reports, for the week ending May 21, are from places in which burial permits are not required:

Allegheny, Pa., 79,000; deaths, 19; under 5 years, 12; accident 1, cerebro-spinal meningitis 3, consumption 1, diphtheria 1, scarlet fever 3, congestion of lungs 1, bronchitis 1, whooping-cough 1. NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JUNE 11, 1881. [No. 50.

SANITARY LEGISLATION IN LOUISIANA.

Dr. S. S. Herrick, secretary of the Louisiana State board of health, forwards copies of the following circular, ordinances, and acts of legislature, relating to sanitary inspection and measures:

[Circular No. 1.]

BOARD OF HEALTH, STATE OF LOUISIANA.

Sanitary measures to be enforced by the sanitary inspectors of the city of New Orleans.

OFFICE OF THE BOARD OF HEALTH
OF THE STATE OF LOUISIANA,
State House, May 16, 1881.

1. House-to-house inspections must be pressed as rapidly as possible.
2. Order the abatement of all nuisances.
3. Order the emptying and disinfection of all foul privies.
4. Order the periodic disinfection at intervals of not less than seven days of all privies and water-closets.
5. Order the cleaning and disinfection of all foul alleys and yards.
6. Enforce the ordinance which compels all citizens to place the garbage and refuse matters of dwellings, hotels, stores, markets, manufactories, and stables in boxes or barrels, or other suitable receptacles, for removal by the garbage-carts.

DISINFECTION.

The board of health of the State of Louisiana deem it important that the people should be instructed with regard to the value and importance of disinfection for the removal of foul gases and emanations, and for the destruction of the poisons of infectious and contagious diseases.

To accomplish the greatest good for the preservation of the health of the people, disinfection should be practiced at regular intervals throughout the entire year: but more fully and frequently in the city of New Orleans during the months of May, June, July, August, September, and October.

By disinfection and household sanitation, the people should seek to avert or prevent pestilence, and should not delay the practice of these important measures until disease is actually developed by the neglect and violation of sanitary laws. Each citizen, therefore, by obeying rigidly sanitary laws, becomes the guardian of the health of his household.

New Orleans is without sewers, and the privies necessarily contain at all times an immense amount of fecal matter. Even under the most energetic system of removal of the contents of the privies it is essential that disinfectants be used in this hot, moist climate at regular intervals. It should be borne in mind, however, that disinfection cannot be substituted for want of cleanliness or of ventilation, but should be used for the prevention of those putrefactive processes which result in the generation of compounds and agents deleterious to man.

In the selection of disinfectants reliable agents should be secured, which can be procured in a state of purity, and at so small a cost that they can be used in adequate quantities and at stated intervals.

DISINFECTANTS.

Disinfection of privies and water-closets.

For the disinfection of privies, cess-pools, water-closets, and vaults use the following: Sulphate of iron (green vitriol or copperas), eight pounds; Calvert's carbolic acid, No. 5, one pint; water, four gallons. Dissolve the green vitriol in hot water, and when cool add the carbolic acid. Add one gallon of this mixture to the privy or water-closet to be disinfected, and thereafter one quart every fifth day, or oftener, if any foul smell be evolved from the privy.

Lime should not be used in the disinfection of privies, as it decomposes the salts of ammonia.

This objection, however, does not apply to the sulphate of lime (plaster of Paris), which may be used with advantage in combination with carbolic acid and copperas.

The walls of privies and all unpainted wood-work should be whitewashed.

Foul drains, damp foul yards, stables, cow-houses, markets, and slaughter-houses.

Fresh-slaked lime, chloride of lime, plaster of Paris, and sulphate of iron should be sprinkled over damp and foul places, drains, and yards. For disinfection of such places a simple solution of sulphate of iron or copperas, in proportion of one and a half pounds to the gallon, may be used. The copperas solution may be prepared in large quantities for markets, stables, and slaughter-houses, foul yards, drains, and gutters by hanging a basket containing about seventy pounds of copperas in a barrel of water.

JOSEPH JONES, M. D.,
President Board of Health.

OFFICE BOARD OF HEALTH, STATE OF LOUISIANA,
New Orleans, ———.

———— ————, M. D.:

DEAR SIR: Your attention is invited to the following:
Ordinance, May 18, 1870.

SECTION 28. All practitioners of medicine, masters of any water craft, hotel, boarding or lodging house keepers, principal or masters of any boarding school or seminary, the chief officers or persons in charge of any public institution of charity or asylum, or otherwise, are hereby required to report, within twenty-four hours, to the office of the board of health, all cases within their cognizance of Asiatic cholera, yellow fever, typhus or ship fever, malignant scarlet fever, small-pox, varioloid, trichiniasis, or any other case that may at any time be specified by the board of health, and in default or failure to so report such cases, such person so failing or in default shall be liable to a fine not to exceed fifty dollars: *Provided, however*, That said board may declare it unnecessary to report further cases when any disease shall have been pronounced epidemic.

In addition to the list of diseases named above the board of health desire cases of diphtheria to be reported in like manner, and trust that you will never neglect to give timely information at this office, in accordance with the terms of the ordinance.

Very respectfully,

JOSEPH JONES, M. D.,
President.
S. S. HERRICK, M. D.,
Secretary.

OFFICE OF THE SUPERVISING INSPECTOR OF
THE NATIONAL BOARD OF HEALTH,
New Orleans, La., May 24, 1881.

———— ————.

DEAR SIR: It has been made my primary duty, as "the representative and chief executive agent" in this city of the National Board of Health, "to obtain the earliest possible information of the existence of yellow fever in New Orleans or its vicinity." To fulfill this duty, I am instructed, among other measures, *to endeavor to secure* from the "physicians of New Orleans and of the river parishes below New Orleans," and from the "sanitary and medical organizations of the city," prompt information "as to the presence of cases of yellow fever, or of doubtful or suspicious cases of this disease."

There are three considerations which deserve your attention when determining the question whether you will contribute this information: First, the health authorities of neighboring States insist that prompt notification of the whole truth respecting the appearance of yellow fever in New Orleans is indispensable for their own protection, and warn us that any failure to furnish this information will force them so to act that far greater detriment would thereby result to this city than from reports of all the facts. Second, all must concede that if the spread of yellow fever can be prevented, sanitary measures should be speedily applied to the very earliest cases, whether real or reasonably suspected. Third, the laws of Louisiana, as well as the regulations (authorized by the laws of the United States) of the National Board of Health, inferentially declare that yellow fever is a portable disease, inasmuch as they provide means to prevent its importation and its spread, and the ordinances of the city of New Orleans enforce the same view by enjoining the prompt report of all cases of this disease to the State board of health; hence, all law-abiding physicians and citizens are bound to facilitate the application of these

measures, even though they in some instances may be convinced that our laws are founded in error, and that no available measures can be or will be applied to prevent the importation and spread of yellow fever.

These facts justify this application to you for the aid indicated, and while you are under no legal obligation to give this aid to a sanitary officer of the National Board of Health, it is none the less believed that your compliance would not only promote the public welfare and the interests of science, but also would relieve you, in respect to the public health, from a very grave responsibility officially imposed on others.

Where the objection of the patient or of his attending physician would make my inspection of the former, in company with the latter, unadvisable, the attending physician is earnestly requested to keep and promptly to report a careful record of the history of every case which he knows or fears to be yellow fever; and the same course is deemed very desirable respecting all cases of hæmorrhagic malarial fever, or of other fevers which simulate yellow fever. Any summons for or report to me should be sent to my office, in the third story of the University building, at the corner of Common and Baronne streets, or to my residence, No. 24 South Rampart street, between Common and Canal streets, and any necessary expense incurred therefor will be refunded. If there should be satisfactory cause to request it, Dr. S. M. Bemiss, resident member of the National Board, would, no doubt, consent to serve as my substitute in examining any cases or supposed cases of yellow fever.

In order that you may better understand the character and purpose of the aid requested, a printed copy of my official instructions is inclosed, to which, and especially to Appendix D, your attention is solicited.

Since it is most important that I should know what are to be the sources of information upon which I can rely, you are earnestly requested to reply to this communication, furnishing your full address (and, if in the country, the location of your practice), and stating whether you will be good enough to give the aid solicited.

Very respectfully, yours,

STANFORD E. CHAILLÉ, M. D.,
Supervising Inspector of the National Board of Health,
P. O. Box 1689, New Orleans, La.

REPORT OF COMMITTEE AND RESOLUTIONS.

NEW ORLEANS, *May* 12, 1881.

SIR: Your committee, appointed to investigate certain complaints of citizens concerning the conduct of the nuisance wharf and the removal and final disposition of night-soil, beg leave respectfully to submit their report.

After a careful inspection of the nuisance wharf and boat, your committee is convinced that these complaints are true and should be immediately corrected. The rules and regulations of circular No. 2 issued by President Joseph Jones, M. D., August 3, 1880, are not complied with, at least not in the efficient manner as prescribed in said circular. We therefore recommend the strict enforcement of sec. 1, *a* and *b*, sec 2, sec. 3, sec. 4; we further recommend that two policemen at least should be detailed. Sec. 5, *a* and *b*, with reference to the nuisance wharf and boat, says:

"The windows of the house devoted to the reception of night-soil should be closed during the emptying of the barrels into the hold of nuisance boat, and during the discharge of the excrements into the boat, fresh air should be fully supplied to the house by means of bellows."

No such bellows are provided for, and it is utterly impossible for any human being to exist in such an atmosphere as created in these little rooms by the discharge of the excrements out of the barrels into the hold of the nuisance boat, without opening the doors or windows, and by allowing the free discharge of all accumulated stench.

Your committee therefore would recommend that the discharge out of the barrels into the hold of the boat should be done by some odorless apparatus, as now employed by the vidangeurs for the emptying of privies. A small engine would facilitate the work, and in this manner the emptying of the barrels could be accomplished odorless and without endangering the health of the employés and citizens living in the neighborhood of the wharf. In case the contents of the barrels are solid and of such a nature that they cannot be removed by the pumps, the barrels containing them should be taken on deck of the boat and emptied below the limits of the city, left bank below the red light of the United States barracks and right bank below the cluster of trees opposite United States barracks, below the settlement.

The openings for ventilation upon the roof of the house should be larger and the ventilating shafts higher, provided with charcoal furnaces, as prescribed, in which fire should be kept burning constantly during the day.

Sections *d* and *e* should be strictly enforced.

We would further recommend that at least one or more boats should be located in the different districts of the city. The distance of the present and only nuisance boat is too great from the city proper to accomplish any work, and it is of the greatest importance that the privies should be kept constantly clean, which, in our opinion, is utterly impossible with only one nuisance boat located such a distance from the most populated parts of the city.

Most respectfully,

Dr. F. LOEBER, *Chairman.*
J. C. BEARD, M. D.
E. HERNADEZ.

DR. JOSEPH JONES:
President Board of Health, State of Louisiana.

Resolutions of board of health May 13, 1881, *relative to vidangeurs and nuisance wharf.*

BY DR. BEARD.

That we fully endorse the action of the president of the board, instructing sanitary officers to make affidavits against all vidangeurs who have violated and shall hereafter violate the law and health ordinances.

That the attorney of the board is instructed to prosecute all cases now pending and hereafter arising from such arrests.

A true copy from the minutes.

S. S. HERRICK, M. D.,
Secretary Board of Health.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BAD LANDS CANTONMENT.—Dr. C. C. Miller, United States Army under date of June 1, reports that 3 cases of measles have occurred during May, at the railway station, about a quarter of a mile from the post. The patients were placed in a tent and isolated: the disease has not appeared at the post.

LITTLE ROCK, ARK.—Dr. J. A. Dibrell, secretary of the State board of health, forwards a set of the several blank forms adopted for statistics, &c., by the board as organized under the act published in No. 41 of the BULLETIN.

VIRGINIA CITY, NEVADA.—Dr. E. B. Harris, under date of May 29, states that the cities of Virginia and Gold Hill have recently been consolidated. Under the new act of incorporation, Dr. Harris resigns his position as president of the local board of health, which office is filled by Dr. Hall.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

ABSTRACTS FROM CONSULAR REPORTS.

ALGIERS.—The report of United States Commercial Agent A. Jourdan covers the five weeks ending April 3. During this period 308 deaths were reported, giving an average annual death-rate of 47.2 per 1,000, the population being estimated at 68,055. The only contagious disease noted is typhoid fever, from which five deaths occurred. Among other causes were: pneumonia, 36; bronchitis, 14; croup, 27; consumption, 48; diphtheria, 2; and diarrhœa, 24. The large comparative mortality from diseases of the respiratory organs is ascribed to the fact that many persons already far advanced in chronic diseases of that kind seek Algiers as a sanitarium only to die there.

CONSTANTINOPLE.—The following extracts are made from the telegrams of Dr. Zitterer with regard to the plague in Mesopotamia:

1. *April* 29.—The plague has spread from Chatieh to a neighboring village of 60 inhabitants; 6 cases and 5 deaths occurred before the huts were burned and the people put into camp.

In Nedjeff some 3,000 people remained after the evacuation; of these 80 died April 24, and 50 April 25.

2. *May* 8.—The whole population within the *cordons* is estimated at 11,000. The plague has ceased at Djaara and vicinity. News from Karbella and other points indicate a decline of the disease. Mortality in Nedjeff has averaged 56 per day from April 26 to May 2. The forced evacuation of Nedjeff, with thorough disinfection before the return of the people, are strongly urged, as also the exclusion of all pilgrims till these measures shall be carried out.

A dispatch from Alexandria, of May 17, officially denies the report of a case of plague in Egypt.

GHENT, BELGIUM.—United States Consul A. Lefebvre reports, for the month of April, two deaths from small-pox, 8 from typhoid fever, 3 from scarlet fever, and 3 from diphtheria. Total deaths, 325; population, 134,852; annual death-rate, 29.3 per 1,000. From non-contagious diseases, there were 54 deaths from consumption, 51 from other lung diseases, 12 from heart diseases, and 56 from diarrhœal diseases.

NASSAU, BAHAMAS.—United States Consul T. J. McLain, jr., reports for the first two weeks of May that no contagious or epidemic disease has appeared on the island.

QUEENSTOWN, IRELAND.—In his report for the week ending May 14, United States Consul E. P. Brooks observes that three cases of small-pox are in the receiving hospital, coming from Philadelphia "in return for the compliment of two cases developed *en voyage* from London to Philadelphia, via Queenstown."

SAMOAN ISLANDS.—The reports of United States Consul T. M. Dawson for the month of February indicate a good sanitary condition in the port of Apia, and no contagious disease is reported.

SINGAPORE.—Reports from United States Consul A. G. Studer, to April 18, show that this town and district continue free from contagious or epidemic diseases.

TASMANIA.—United States Consul A. G. Webster sends reports for December, 1880, and the first two months of 1881. During the three months there were 168 deaths in Hobart, having a population of 27,500. Annual death-rate, 24.5 per 1,000. No complete records are kept, but cholera, yellow fever, small-pox, and plague are believed to be unknown in Tasmania.

TUXPAN, MEXICO.—Dr. A. M. Boyd, under date of May 3, reports 15 deaths during the month of April. Of these, 8 were from malarial fevers and 2 from consumption. Annual death-rate, 25.0 per 1,000.

VALPARAISO, CHILI.—United States Consul L. H. Foote reports for the month of March 69 deaths from lung diseases, 142 from fevers, 41 from consumption, and 430 from all causes. Population, 101,088; annual death-rate, 50.0 per 1,000.

For the month of April, 31 deaths from consumption, 68 from other lung diseases, and 91 from fevers. No contagious disease is reported. Total deaths, 408; population, 101,088; annual death-rate, 49.1 per 1,000.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge, in his report for the week ending May 8, states that the new city administration refuse to publish the daily and weekly reports of mortality in the city, so that in future only monthly reports can be furnished.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JUNE 18, 1881. [No. 51.

MONTHLY REVIEW FOR MAY, 1881.

The weekly reports for this month represent a mean population of 8,126,743, being an increase of 208,119 as compared with April. The general death-rate has fallen from 24.88 to 23.49, the decline in deaths from pulmonary diseases not being yet balanced by the increase in diarrhœal diseases. The contagious zymotics also show a general falling off, and the slight increase of the rate of infant mortality from 8.64 to 8.89 per 1,000 is to be ascribed to diseases of the digestive system. These showed a rapid rise in the second and third weeks of May, following the remarkably high temperature prevailing in the early part of the month. A decline in the mortality from this class of diseases is noted in the last week, when a great reduction of temperature occurred.

Causes of death.—The general reduction of death-rate from pulmonary diseases is shown in the fall of consumption from 3.81 to 3.28 per 1,000, or 15 per cent., and of acute lung diseases from 3.48 to 2.47, or 29 per cent. Cerebro-spinal meningitis shows a total increase of only 3 per cent. since April, and still ranks below scarlet fever. The upward movement of diarrhœal diseases may be now considered established, but it will not be likely to reach the remarkable maximum of July, 1880, when the general death-rate from these diseases alone was 12.6 per 1,000 during the first week. In 1879 the maximum was about 7 per 1,000, and it will be a point of interest to observe whether this year will exhibit the reduction in heat diseases which should follow the regular alternation of comparatively hot and cool summers on the Atlantic coast, which has been noted by a reference to thermal records.

Northwest	49	0.35	1.66	64	0.45	2.17	196	1.38	6.65	50	0.35	1.70	71	0.40	2.41	25	0.17	0.85	33	0.23	1.12	14

Distribution of diseases.—In the Northeast section the greatest reduction of general mortality is observed, the rate having fallen from 25.64 to 22.96 per 1,000. This improvement is evidently due chiefly to the less mortality from pulmonary diseases, though the zymotic diseases also show a tendency to decline. Diarrhœal diseases have advanced from 0.29 to 0.47, or 18 per cent.

Southeast section.—Here the pulmonary affections show nearly the same rate of decline (25 per cent.) as in the Northeast, and the rise of the general death-rate from 27.46 to 27.59 is to be ascribed to the increase of diarrhœal diseases, which have advanced from 0.85 to 3.16 per 1,000. The other zymotics show a considerable decline, enteric fever alone having slightly increased.

Northwest section.—In these States cerebro-spinal meningitis, which causes only 0.45 deaths per 1,000 in the other sections, rises to 1.53, the distribution seeming to be very general, and the mortality in proportion to the populations represented. The fall of the general mortality from a rate of 22.30 to 20.84 per 1,000 is due to the decline in consumption and lung diseases, as in other sections; this section also shows a general reduction in the contagious diseases, but diarrhœal diseases have advanced from 0.53 to 1.38 per 1,000. During the month of May 312 deaths from small-pox were reported from 20 different places, showing a wide distribution of the disease. In New York City it seems to be increasing steadily, while it is declining in Philadelphia, probably from exhaustion of material. The deaths reported are distributed as follows: New Haven, Conn., 1; New York, 66; Brooklyn, 5; Buffalo, N. Y., 1; Hudson County, N. J., 11; Camden, N. J., 3; Philadelphia, 122; Pittsburgh, Pa., 7; Wilmington, Del., 32; District of Columbia, 1; Richmond, Va., 2; New Orleans, 1; Louisville, Ky., 2; Cincinnati, Ohio, 3; Evansville, Ind., 1, Chicago, 43; Lake, Ill., 2; Peoria, Ill., 1; Kansas City, Mo., 2; San Francisco, 6.

The subjoined Circular No. 7 is reprinted. Further rules may be added from time to time as experience may suggest to be necessary and proper.

CIRCULAR No. 7.

The following rules govern the action of the National Board of Health at present in aiding State and local boards to enforce regulations of such boards preventing the introduction of contagious and infectious diseases into the United States, or into any one State from another:

1. The regulations to be enforced are those of State and local boards, whether adopted at the recommendation of the National Board or otherwise, and not those of the National Board. The National Board has recommended certain regulations for adoption by State and local boards. Up to the present time these recommendations have been adopted by the following boards, viz:

The State boards of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, New Jersey, North Carolina, and Tennessee; the local boards of Brunswick, Ga., Brownsville, Tex., Bayou Sara, La., Cairo, Ill., Carlinville, Ill., Decatur, Ala., Delhi, La., Fernandina, Fla., Huntingdon, Tenn., Jacksonville, Fla., Lauderdale County, Mississippi, Meridian, Miss., Mobile, Ala., Pensacola, Fla., Shelbyville, Tenn., Saint Louis, Mo., Tampa, Fla., Vicksburg, Miss.

The regulations of the above-named boards are therefore to a certain extent uniform, and approved by the National Board, and therefore are such as it will aid in enforcing when necessary.

State and local boards which have not adopted the recommendations of the National Board are requested to do so as soon as convenient, in order to secure uniformity of action.

It should be observed that these recommendations are for a minimum amount of precaution, and therefore that additional precautions may be taken by State and local boards if deemed necessary, it being borne in mind all the while that the end in view is to secure or restore the public health by measures which interfere with travel or traffic as little as possible; in other words, to render commerce secure; and (with rare exceptions) *not to put an end to, or even suspend it.* In this connection it is proper to add that non-intercourse quarantines, especially by *local* authorities, are not approved by this Board.

2. Applications to the National Board of Health for aid should be made by or through the State board, or in case there is no State board, then by or through the governor of the State.

3. Applications for aid should give *details* of what is required, and the estimated cost for each item. Among other things should be specified the duties and powers of the officers whose appointment or payment is requested.

4. The application should be accompanied by an official certificate from the governor of the State or the mayor or other chief officer of the municipality, respectively, to the effect that there are no State or municipal funds available to carry out the particular sanitary measures because of which the application is made. Official information should be given therein of the adoption by such State or local board of any rules and regulations that have been recommended in such case by this Board, and of any other State or local rules and regulations that appear to be necessary for the purpose in question.

5. Of the supplies required for the sick those furnished by this Board to local authorities shall, as a general rule, be applied to other objects than those of shelter and furniture, which should be furnished by such authorities. Where, however, it shall be otherwise ordered the local authorities will be expected to account to this Board from time to time for the safe-keeping and proper use of the furniture, provisions, medicines, &c., so furnished.

6. Whenever this Board shall order the erection of temporary buildings, or provide any buildings for the purpose of quarantine, the necessary contracts therefor shall be made by one of its own officers or agents, subject to the approval of the board or of its executive committee.

7. Care should be taken that the officers to be paid from funds furnished by the National Board are employed only in such number and for such time as there is actual need of their services. The National Board of Health reserves the right of judging from time to time, by means of reports received from its own agents, whether such need exists.

8. Funds are not furnished by the Treasury to State or local boards. They are placed in the hands of the disbursing clerk of the National Board of Health, by whom bills, properly certified and approved, will be paid by check on Washington or New York. All bills must be in accordance with the estimates as approved by the Secretary of the Treasury, must be made out in duplicate on forms furnished by the National Board, and be *certified*, as to their correctness, by some authorized officer of the State board or by the governor of the State, and must be approved by some member or special inspector of the National Board duly authorized. All bills for services rendered or for articles furnished local or State boards must be sworn to by the person rendering the service or furnishing the articles.

The names of all persons whose services as inspectors, &c., are to be paid for out of its funds must previously to their appointment be submitted to and approved by the National Board.

It is expected that at the close of the season a full report will be made by State boards of health to the National Board as to their operations in carrying out those rules and regulations for the prevention of the spread of yellow fever in which the National Board has rendered aid and co-operation, and it is desired that copies of all orders issued from time to time to inspectors shall be promptly furnished to this Board.

It is to be remembered that a full account of its expenditures must be made by the National Board of Health to Congress, and that such account ought to set forth these expenditures in detail, and exhibit their propriety and necessity.

It is therefore essential that State and municipal boards shall co-operate with the National Board in supplying material for such an account, and it is earnestly desired that they will preserve and furnish due evidence of the propriety of each item of their expenditure for both persons employed and articles purchased with the funds in question; particularly as the future aid of both State and National Boards must depend largely upon the record for efficiency and economy made during the year now current.

9. State and municipal boards of health which receive aid from this Board are requested to furnish weekly reports to this office of their operations, including copies of orders issued by them and of reports made to them by their quarantine and sanitary inspectors with reference to the occurrence of cases of yellow fever or other contagious diseases, and to measures adopted for isolating such cases; such reports to be presented in a form suitable for publication in the BULLETIN.

ABSTRACTS FROM CONSULAR REPORTS.

CONSTANTINOPLE.—United States Consul G. H. Heap forwards telegrams from Mesopotamia to May 24. No important changes are reported in the infected district, but the plague is gradually subsiding. The rules of quarantine are not relaxed, and active measures of cleaning and disinfection are enforced in the villages and towns evacuated during the pestilence.

NAPLES, ITALY.—United States Consul E. H. Smith, under date of May 25, states that the board of health at Naples has determined to change the form of their weekly and monthly reports of mortality. In the form now adopted only the deaths are given; cases of disease not fatal are not recorded.

SMYRNA.—United States Consul B. A. Duncan, under date of May 2, informs the Department of State that the Russian Government has issued orders to quarantine for ten days all vessels arriving at any Russian port from the Levant, unless furnished with certificates from the Russian consuls of the absence of contagious disease at the port of departure and other ports visited during the voyage. Some doubt is expressed as to the limitation of the plague in Mesopotamia by the *cordons*, and neighboring countries are afraid of the extension of the disease by caravans and pilgrims, which are the principal agents in spreading contagion in the East.

SAGUA LA GRANDE, CUBA.—Under date of June 8, United States Commercial Agent J. F. Swords reports that during the past week 3 deaths from yellow fever had occurred. All of the victims were resident less than five years in the island.

The harbor and shipping are free from contagious diseases.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

HAVANA, CUBA.—The report for the week ending June 3 shows only 1 death from yellow fever. Small-pox caused 26 deaths, and 3 were from typhoid fever. During the month of May there were 6 deaths from yellow fever, 120 from small-pox, and 42 from typhoid fever. On board of the British steamship *Nankin*, which arrived at Havana June 3, *en route* for New York, a second-cabin passenger was found sick with fever of a suspicious character and having albuminous urine. The patient was removed to hospital, the room was disinfected, and the bedding, &c., destroyed.

During the week ending June 10, there were 7 deaths from yellow fever, of which 5 were in the military hospitals. Small-pox caused 25 deaths and 7 were from typhoid fever.

The Spanish bark *Angela* sailed for Mobile June 10 without a bill of health. It is believed that yellow fever occurred on board of this vessel in July, 1880, while at Havana.

The American bark *Moonbeam* also sailed for Searsport without bill of health, and the refusal to take one is always to be considered suspicious.

SHELBYVILLE, TENN.—Under date of June 11, Dr. C. Fite reports two cases of cerebro-spinal meningitis occurring in one house. The house was in a filthy condition and the two children attacked had recently recovered from measles. Both were taken sick on the same day; one died and the other is convalescent.

Dr. Fite, who is secretary of the local board of health, observes that increased interest in sanitary work and a more general appreciation of its value by the people are to be noted in most parts of the country.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

TRUXILLO, HONDURAS.—Dr. W. L. Hammond, U. S. Army, under date of June 1, reports that the harbor and vicinity are free from contagious diseases, and clean bills of health are issued. Due precautions are taken by the local board of health to secure proper examination and inspection of vessels.

THE NATIONAL BOARD OF HEALTH.

OFFICERS.

JAMES L. CABELL, LL. D., &c ..... *President.*
JOHN S. BILLINGS, Surgeon United States Army ..... *Vice-President.*
THOMAS J. TURNER, Medical Director U. S. Navy ..... *Secretary.*

The following reports for the week ending June 4, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 79,000; deaths, 25; under 5 years, 13; accidents 2; cerebro-spinal meningitis 2, consumption 2, typhoid fever 1, scarlet fever 3, pneumonia 2, bronchitis 1, puerperal 1. Bath, Me., 8,000; deaths, 5; under 5 years, 1; congestion of lungs 1, measles 1. Brattleborough, Vt., 6,000; no deaths. Calais, Me., 6,172; deaths, 3; accidents 1, diarrhœa 1. Carrollton, Miss., 600; no deaths. Clinton, Mich., 1,200; no deaths. Coldwater, Mich., 5,000; no deaths. Corinth, Miss., 2,264; no deaths. Crystal Springs, Miss., 955; no deaths. Decatur, Miss., 1,000; no deaths. Greenville, S. C., 6,500; deaths, 2; under 5 years, 1. Helena, Mont., 3,630; deaths, 1. Huntingdon, Pa., 4,500; deaths, 2; under 5 years, 1; accident 1. Huntingdon, Tenn., 1,200; deaths, 1; typhoid fever 1. Indianola, Tex., 900; no deaths. Iuka, Miss., 816; no deaths. Kenosha, Wis., 5,500; deaths, 2; under 5 years, 2; croup 2. La Salle, Ill., 8,885; no deaths. Louisiana, Mo., 5,000; death, 1. Madison, Ind., 9,009; no deaths. Martinsburg, W. Va., 6,334; deaths, 3; consumption 1. Meridian, Miss., 4,013; deaths, 2; under 5 years, 1; measles 1. Milan, Tenn., 1,800; no deaths. Milford, Mich., 1,400; no deaths. Milledgeville, Ga., 3,000; deaths, 2; under 5 years, 1; diarrhœa 1. Muskegon, Mich., 11,300; deaths, 6; under 5 years, 1; consumption 1, measles 1, accident 3. Painesville, Ohio, 5,504; no deaths. Pass Christian, Miss., 3,000; no deaths. Pearlington, Miss., 1,200; deaths, 1. Pleasant Hill, Miss., 253; no deaths. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, Cal., 5,000; deaths, 2; puerperal 1. Shannon, Miss., 500; death, 1. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; death, 1. Titusville, Pa., 9,046; no deaths. Tuscaloosa, Ala., 2,000; no deaths. Winchester, Va., 5,000; no deaths. Youngstown, Ohio, 15,421; deaths, 3; consumption 1. Total population, 229,116; number of deaths, 62; deaths under 5 years, 20; annual rate per 1,000, 14.1.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

National Board of Health

BULLETIN.

VOL. 2.] WASHINGTON, D. C., SATURDAY, JUNE 25, 1881. [No. 52.

CARBONIC OXIDE AS A SOURCE OF DANGER TO HEALTH IN APARTMENTS HEATED BY CAST IRON FURNACES OR STOVES.

[By IRA REMSEN, Professor of Chemistry in the Johns Hopkins University.]

In 1865 a peculiar epidemic occurred in Savoy. It was a new thing, and consequently new theories were put forward to explain it. Among these, the one which attracted most attention was that of M. Carret, who, in a communication* read before the French Academy, attempted to show that the disease was due to the use of cast-iron stoves, from which in some way carbonic oxide was given off, thus contaminating the air.

General Morin then became interested in the subject and requested† Messrs. H. Sainte-Claire Deville and Troost to make a chemical examination of the air in immediate contact with a specially constructed cast-iron stove heated to redness, as he thought that Carret's statement might possibly be explained by supposing that carbonic oxide passes through the red-hot iron, as earlier experiments of Deville and Troost had shown that this is possible. The work undertaken by the last-named chemists led them to the belief that carbonic oxide may and does pass through cast iron heated to redness. As their experiments were the first undertaken to determine whether cast-iron stoves are objectionable or not, and as the names of the chemists have carried great weight in the discussion of the question, it is desirable to know here exactly what they did.‡

They first analyzed the air of a room heated by a cast-iron stove and found considerable quantities of carbonic oxide and of hydrogen. They then took the apparatus furnished by General Morin, consisting of a specially constructed cylindrical cast-iron stove, surrounded by an envelope of cast iron fitting into grooves in plates above and below the stove. The air was drawn out of the space between the stove and the envelope, and then passed over pumice-stone moistened with sulphuric acid and over caustic potassa. Thus freed from water and carbonic acid, it was passed into a combustion tube containing heated cupric oxide, the water and carbonic acid thus obtained weighed, and the weights of hydrogen and carbonic oxide deduced from those of the water and carbonic acid. The amounts found vary between 0.250 and 1.072 parts hydrogen, and between 0.141 and 1.32 parts carbonic oxide in 1,000 parts of air. These experiments have been justly criticised by others, and I only record the judgment of every thinking chemist when I say that the experiments do not furnish satisfactory proof of the presence of carbonic oxide in the air. In the first place, there is always present in the air a certain amount of organic matter of complex nature which by combustion will yield carbonic acid and water, and hydrocarbons which are, as is well known, formed in large quantity by the heating of coal might also be present in the space immediately surrounding the stove. These would also yield carbonic acid and water by combustion.

A little later the French Academy, impressed with the importance of the subject, appointed a committee, consisting of MM. Payen, Morin, Fremy, H. Sainte-Claire Deville, Boussy, and Claude Bernard, to make a thorough investigation. The committee began work in March, 1868, and continued until February, 1869, when General Morin, at the request and in the name of the other members, handed in an exhaustive report to the academy.§

The work reported upon comprised mainly:

1. Experiments on rabbits.

By a method suggested by Claude Bernard, but not described in the report, it was determined that the blood of rabbits kept for three days in rooms heated with cast-iron stoves contained carbonic oxide.

2. Direct analyses of the air of the examined rooms by the method of Deville and Troost.

3. Experiments with the above-mentioned stove used by Deville and Troost.

4. Collection of carbonic oxide itself by passing the air through a vessel containing a solution of cuprous chloride in hydrochloric acid. The gas thus collected was then set free and burned, when, from the characteristic color of the flame, the conclusion was drawn that the gas was in fact carbonic oxide.

As a result of the investigation, the conclusion was reached: That cast-iron stoves, as soon as their temperature reaches dark red heat, cause the escape of not inconsiderable quantities of carbonic oxide, a very poisonous gas.

It is not surprising that this opinion of a committee composed of such eminent scientific authorities produced a strong impression. The conclusion quoted has been pretty generally accepted as final, and cast-iron stoves have naturally come into distrepute. Hot-air furnaces made of cast iron have also suffered, and "furnace air" has often been used to signify air contaminated with carbonic oxide. The matter is evidently one of great importance from the standpoint of hygiene, and it is desirable here to inquire how far the report of the French commission can stand the test of unprejudiced criticism.

In the first place, the experiments with the rabbits, upon which so much stress is laid as proving the presence of carbonic oxide, are not fully described in the report, and, so far as I know, they have not been described since. It is impossible for this reason to determine to what extent these particular experiments may be relied upon as furnishing the evidence which they are supposed to furnish. There is only one good method known for the detection of carbonic oxide involving the use of animals, and this was introduced some years after the report under consideration was published. If the committee really used a reliable method it is strange that in the active discussion which has been carried on within the last three or four years with reference to the value of their report the details of the method have not been published. Under the circumstances it seems to be justifiable to disregard the indefinitely described experiments with rabbits.

As regards the direct analyses, the case is more difficult. The method used was the same as that of Deville and Troost, already referred to. The calculation of the results was, however, made in a different way. Instead of assuming that all the hydrogen of the water found was originally present as free hydrogen and all the carbon as carbonic oxide, the fairer assumption was made that some of the hydrogen, at least, was present as marsh gas. This would at once reduce the quantity of carbonic oxide found. The experiments show that carbonic oxide was present to the extent of 0.04 per cent., or 4 parts in 10,000, and that in some cases the amount was even greater.

It is plain from these experiments that, after the carbonic acid was removed from the air experimented on there were left other substances containing carbon and hydrogen; and inasmuch as the amount of hydrogen present is not sufficient to account for all the carbon, assuming the two elements to be united in the form of marsh gas, the conclusion is drawn that carbonic oxide must be present. But this conclusion is by no means certainly correct, and there are mainly three good reasons for doubting its correctness until further evidence is brought forward in its support. These are:

1. The fact that hydrocarbons other than marsh gas and containing a larger proportion of carbon not only may be present, but are just as likely to be present as marsh gas.

2. The fact that there are always present in the air organic substances of unknown composition which by combustion would increase the quantity of carbonic acid found. Erisman* found such substances in an unoccupied and unheated room by using the method of Deville and Troost, and Dupré and Hake† have very recently described some experiments undertaken for the purpose of determining the amount of organic matter in the air. The last-named chemists took extraordinary precautions to remove the carbonic acid and water from the air before it was heated with cupric oxide, and they distinctly state that these precautions are necessary. While not claiming any great degree of accuracy for the figures given by Dupré and Hake, they certainly do show that the organic matter in the air should be considered in such experiments as those under special scrutiny at present.

3. The fact pointed out by Dupré and Hake, and just referred to, that it is very difficult to remove all the carbonic acid from the air before it reaches the combustion tube. In experiments long continued and involving large volumes of air the error occasioned in this way might be comparatively large. Again, taking everything into consideration that bears upon these direct analyses, it will be seen that the evidence which they afford of the presence of carbonic oxide is far from conclusive.

Much weight cannot be attached to the experiment in which the carbonic oxide was collected and afterwards burned. The only evidence that the gas thus collected was really the oxide was obtained by burning a few cubic centimeters and taking the color of the flame as the test. It cannot be denied that other things may have been

present, and that the test was a very unsatisfactory one. These few critical remarks are intended to show that the subject under consideration cannot be regarded as exhausted, and that after the report of the French commission new evidence either for or against the correctness of the conclusion drawn was loudly called for.

A few years ago H. Vogel called attention to a very pretty and delicate method which he recommended as well adapted to the detection of small quantities of carbonic oxide. The method depends upon the action of the gas on blood, and consists in shaking with a little blood the air to be examined and then examining the blood with a spectroscope, the presence of carbonic oxide being revealed by a peculiar absorption spectrum which will be described below. Vogel claims that by this method 0.4 per cent. of the gas can be detected in the air. In a later article the same author describes some special experiments, undertaken at the request of the authorities of the city of Berlin, for the purpose of determining whether carbonic oxide was present in the air of certain school-houses in that city. Although Vogel succeeded in increasing the delicacy of his method, so that he could certainly detect 2.5 parts of the gas in 1,000 parts of air, he was unable to find any evidence of its presence in the buildings examined by him.

J. Gottschalk was also requested by the authorities of the city of Leipzig to examine the air of certain school-houses, and in 1877 his report was published in full, under the title: "Ueber die Nachweisbarkeit des Kohlenoxyds in sehr kleinen Mengen und einige Bemerkungen zu der sogenannten Luftheizungsfrage." (Leipzig, Barth.)

The method used by Gottschalk consisted in passing the air to be examined through a neutral solution of palladium chloride. When carbonic oxide passes through such a solution it exerts a reducing action; small, black flakes of the metal appear, and the presence or absence of the gas may be judged of by the presence or absence of the black flakes. It is undoubtedly true that carbonic oxide acts in the way described, and that very small quantities of it may be detected by means of the reaction mentioned; but it is also true that certain hydrocarbons which are likely to be in the air in the neighborhood of stoves and furnaces act in the same way. Hence, if the solution of palladium chloride were changed by the air, we should have evidence of the presence of either carbonic oxide or hydrocarbons, or, possibly, some of the easily oxidizable organic matters always present in the air. If, on the other hand, no change were produced, we might fairly conclude that carbonic oxide is not present, at least not in quantity greater than that which the method is known to be able to detect. According to Gottschalk, the method is competent to detect 0.22 parts in 1,000 of air, a fact which was established by a series of experiments undertaken specially for the purpose. In the air of the school-houses Gottschalk found no evidence of carbonic oxide, from which fact the conclusion may be drawn that the gas was not present to the extent of 0.22 parts in 1,000.

The negative results obtained by Vogel and Gottschalk have led to several examinations of a similar kind. In 1878 there appeared an article,* by S. Wolffhügel, in which some of the earlier experiments are subjected to criticism, and some new experiments are described. The article opens with a criticism of the results of R. Kaiser,† who found carbonic oxide in the air of the *Gewerbemuseum* at Nürnberg. The gas was detected by oxidizing with chromic acid solution, and also by absorption in a solution of cuprous chloride in hydrochloric acid. As Kaiser does not describe his experiments with sufficient accuracy to enable the reader to judge of their value, and there are so many precautions necessary in order to insure success, his results are entirely disregarded.

Aug. Vollert‡ has also stated that he had detected carbonic oxide in the air of the Johanneum at Hamburg; but the method used by him is the old one of Deville and Troost, and he entirely neglects the hydrocarbons, so that no weight can be attached to his results.

Wolffhügel's own experiments consisted in making a box on the side of a cast-iron stove so that one square decimeter of cast iron, that could easily be heated to redness, was covered by the box. The box ended in a tube by which connection was made with an aspirator. The air was then examined by means of Vogel's blood test. By means of this test he was able to detect carbonic oxide in tobacco smoke; but in all his experiments with the cast-iron stove the results were negative.

Several important details are lacking from Wolffhügel's description of his experiments. It is not stated, for example, what relation the piece of cast iron which was heated to redness bore to the heated coal within the stove, whether it was above the coal or the coal came in contact w th it. The thickness of the plate of iron is also not mentioned.

Some experiments with cast-iron tubes were next tried. The walls of these tubes were 0.35^{cm} to 0.65^{cm} in thickness, and their internal diameter was from 2.5^{cm} to 5^{cm}. They were placed in blast-furnaces and heated to redness. The air drawn through them contained considerable quantities of carbonic oxide, which was easily detected.

Within a short time past several suggestions have been made looking towards the increased delicacy of the method for detecting carbonic oxide. Among these may be mentioned those of Th. Weyl and B. Anrep*, of C. H. Wolff† and S. v. Fodor‡. None of the suggestions appear to have been followed up very closely, and the papers in which they are described contain no satisfactory evidence in favor of the methods employed. There is one method, however, which deserves special attention as it has been tested very carefully by the inventor, and seems to be admirably adapted to the detection of very small quantities of carbonic oxide. This is the method described by W. Hempel.§ It consists of a modification of Vogel's blood test. By passing air to be examined through dilute blood, Vogel could detect 2.5 parts of the gas in 1,000 of air. Hempel concentrates the effect of the gas by allowing small animals (mice) to breath the air for a considerable period. He then kills the animals and examines the diluted blood with the spectroscope. By this means it was found that a much smaller amount of the gas can be detected than by the original Vogel method. The limit stated by Hempel is 0.5 parts in 1,000, or about one-fifth the limit given by Vogel. Hempel contented himself with proving the value of the method. He mentions no experiments involving the application of his method, nor has it, as far as I can learn, ever been practically used in investigating the question regarding the presence of carbonic oxide in the air of rooms.

In view of the uncertainty connected with the subject and its evident importance, it seemed to me to be desirable to undertake a new investigation, using that method which, after careful study and comparison, should prove best fitted for the purpose; and, at the request of the National Board of Health, I have for some time past been engaged upon the work, in the experimental part of which I have had the valuable assistance of Mr. D. T. Day.

The question which I proposed to answer as far as it lay in my power to do so was this: Is carbonic oxide a constituent of the air of rooms heated by cast-iron stoves and hot-air furnaces, particularly if these are of bad construction and in bad condition? There are plainly two sources of danger to keep in mind: 1st. The passage of carbonic oxide through cast-iron heated to a high temperature; and, 2d. The escape of the gas from fissures in the walls of the stove or furnace.

A careful study of the methods which have been used in all the earlier experiments led me to the belief that better results could probably be obtained by the use of Hempel's method than by any other, though, of course, much depends upon the accuracy of Hempel's statements. If the method is as delicate as is claimed, then it is better adapted to the purpose of such an investigation as this than any other which has ever been used. Accordingly, I first undertook an examination of the method itself, for the purpose of convincing myself of its value. I may say at once that my own experiments fully confirm the statement of Hempel concerning the delicacy of the method, and after an examination of other methods and a comparison of them with this one, I am fully convinced that it is the best one now at our command for the purpose for which it is intended. In order that the experiments described in this report may be intelligible to those who have not familiarized themselves with the method of Vogel already referred to, and of which that of Hempel is a modification, I give here a brief description of the method as used by myself.

THE VOGEL-HEMPEL METHOD OF TESTING FOR THE PRESENCE OF CARBONIC OXIDE.

The original method, as given by Vogel‖, is thus described: "If it is desired to test the air of any room with reference to the presence of carbonic oxide, it is best to empty in the room a flask of about 100$^{cm^3}$ capacity and filled with water. In the empty flask there are then poured 2–3$^{cm^3}$ of blood, so strongly diluted with water that it is only faintly colored red, but at the same time distinctly gives the two known absorption bands when examined in a small test-tube with the spectroscope. If this solution is shaken with the air only one minute, the action of carbonic oxide, if it is present, can be seen even in the change of color of the blood. It appears more of a rose color; the absorption bands are a little paler, less distinct, and moved a little farther to the left than those of pure blood. This change alone is sufficient to enable a skilled spectroscopist to detect the presence of carbonic oxide.

"Those who are less skilled may convince themselves, however, by the addition of 3–4 drops of strong ammonium sulphide, which, as is well known, causes the disappearance of the two bands of pure blood, and the appearance of a broad, indistinct shadow in their place, while the bands of the blood which contains carbonic oxide are not changed by ammonium sulphide."

The smallest quantity of the gas which Vogel could detect was 2.5 parts in 1,000. Hempel's modification of the test consists, as already mentioned, in allowing mice to breathe the air under examination, killing the mice and then proceeding with the blood as Vogel recommends. The mouse used is placed in an apparatus made of two glass funnels joined together at their mouths by means of a wide rubber band. The air is drawn through this apparatus by means of an aspirator, and at the end of the experiment the mouse is killed by the

‖ Berichte der deutschen chemischen Gesellschaft, X, 793, and XI, 235.

most convenient method. I have found it best to drop the animal into a tall and narrow cylinder, and to fill this completely with water, bringing down upon its mouth a glass plate. In a very short time death follows. The mouse is then brought into a small, clean beaker with a little water, and cut in two in the neighborhood of the heart by means of a pair of small, sharp scissors. On squeezing the pieces with a pestle enough dilute blood is easily extracted for the observations. If the mice have been used to examine the air of buildings situated away from the laboratory, the dilute blood, obtained as above described, is best brought into strong glass tubes, so as to completely fill them, and the tubes then tightly corked and taken to the laboratory for examination.

In order to thoroughly accustom ourselves to the use of the method, my assistant and myself made a series of observations, the results of some of which are here recorded.

1. Into a gasometer, the capacity of which is 16,750^{cm3}, and which was filled with air, there were introduced 83.75^{cm3} CO, so that the air contained 0.5 per cent. of the gas. The mixture was allowed to stand about 20 hours to secure thorough mixture of the gases; 10 liters of the mixture were now passed through the Hempel funnel, in which a mouse was placed. In five minutes the mouse appeared to show symptoms of poisoning, and in half an hour it could hardly move. The spectrum of CO was very distinct. The time occupied in the passage of the 10 liters of air was two hours.

2. In the same gasometer as that used in the first experiment, 33.52^{cm3} of CO were introduced with air, the mixture thus containing 0.2 per cent. CO. In other respects the two experiments were identical. The mouse was plainly affected. The blood spectrum gave unmistakable evidence of the presence of CO.

3. 10^{cm3} CO in gasometer mixture contained 0.06 per cent. CO. Time, 2½ hours. Volume of gas, 15 liters. CO spectrum easily recognized, particularly by comparing the blood with that of a mouse unaffected by the gas.

4. Air contained 0.05 per cent. CO. Time, 3 hours. Volume of gas, 14.5 liters. CO spectrum recognized.

5. Air contained 0.04 per cent. CO. Time, 2½ hours. Volume of gas, 14.5 liters. CO spectrum recognized, but weak.

While the experiments thus briefly described will serve to give an idea of the character of our preliminary work, it should be mentioned that each one of the experiments was repeated a number of times with the object of thoroughly accustoming our eyes to the characteristic features of the carbonic oxide spectrum. These repetitions were especially desirable in the last experiments involving the smallest quantities of the gas. At first we were unable to detect 0.05 per cent. with any degree of certainty, but after considerable practice with small quantities we had no difficulty in detecting 0.04 per cent. This is less than the lowest limit mentioned by Hempel, viz, 0.05 per cent., but there can be no doubt in regard to the accuracy of this statement. The experiments with 0.04 per cent. were frequently repeated, and we subjected ourselves to such conditions as to make self-deception impossible. Several specimens were prepared by my assistant, some of them being affected with carbonic oxide, and the rest not; without any knowledge in regard to the nature of the different specimens, they were examined by me, and, after the necessary practice, those which were contaminated with carbonic oxide were detected unerringly. The same process was then reversed. I prepared the specimens, and my assistant detected those which contained the carbonic oxide as readily as I had done. Having thus trained ourselves for the work with this method, and being thoroughly convinced that we can detect carbonic oxide in air when it is present to the extent of 0.04 per cent., or *four parts in ten thousand*, it remained to examine the other methods for which great delicacy has been claimed.

By agitating 10^{cm3} of blood from five to seven times, each time with about six liters of the air to be examined, heating the blood to 90–95°, and passing a current of air through it, and then through an aqueous solution of palladium chloride containing one part of the chloride to 50 of water, S. von Fodor* claims to be able to detect the presence of 0.5 part of carbonic oxide in 10,000 of air. By this method he claims to have detected carbonic oxide in the blood of rabbits which had been kept for some time in an atmosphere containing only 0.4 part of the gas in 10,000 of air. He also recommends the use of test papers prepared by moistening fine filter paper with a 0.2 per cent. solution of palladium chloride; and states that if the air contains $\frac{1}{2000}$ of carbonic oxide the paper becomes covered with a black film in a few minutes; if $\frac{1}{10000}$ the change is effected in 2 to 4 hours; if $\frac{1}{20000}$ in 12 to 24 hours.

The difficulty with this test has already been pointed out. Other substances besides carbonic oxide exert a reducing action on palladium chloride, and the separation of minute quantities of palladium can scarcely be regarded as furnishing very strong evidence of the presence of the gas. I have made a number of trials with this method of von Fodor, but I have not been able to get results as good as those described by him, nor as good as those which I could easily get by using Hempel's method. It may be that in my experiments some essential conditions were not fulfilled, but, at all events, the fact remains that, striving earnestly to give the method a fair trial, I could not finally accept it, and I certainly cannot indorse the statements of von Fodor concerning it.

The same writer claims, further, that the color reactions of blood containing carbonic oxide are better adapted to the detection of the gas than the spectroscope. He recommends that the blood be shaken with ammonium sulphide in a test tube, and then examined by transmitted light. If it contains carbonic oxide it appears red; if not, it is turned violet. This difference in color is said to be recognizable when the blood has stood in a flask of 10 liters' capacity in contact with air containing 0.05 per cent. carbonic oxide. I examined this method carefully, but soon became convinced that it possessed no advantages over the Hempel method, and the results seemed always to be less reliable. While I never failed to detect 0.04 per cent. of the gas by the latter method, 0.05 per cent. was the least that I could detect by means of the color reactions; and I found that the opinion of neither my assistant nor myself could be relied on when it was based solely on an examination by this latter method.

As a result of the work thus far described, then, it will be seen that there is a method the indications of which are unmistakable, and which renders it possible to detect the presence of 0.04 per cent. of carbonic oxide air.

Armed with this method, the next step in the investigation was, of course, to apply the method to the examination of the air of such buildings as seemed to be most suspicious. The indiscriminate examination of buildings without previous careful inquiry in regard to the condition and character of the heating apparatus used in them was not desirable. It seemed best to inquire first of those most likely to be informed in regard to the condition of furnaces in various public and private buildings in this city. Accordingly, a number of the city officials, including the health commissioner, fire commissioners, and others, and several of the leading manufacturers of furnaces and stoves, were visited, and asked for the desired information. My thanks are due to all these, who so readily responded to the questions asked. Much valuable information was gathered in this way. It is unnecessary to go into details in regard to the places which we selected for examination. Suffice it to say that from first to last the air in a comparatively large number of rooms was examined. Whenever a particularly bad furnace was heard of, mice were stationed in the immediate vicinity of the hot-air flues connecting with it. If any special complaint was heard regarding bad air supposed to be caused by a furnace or a stove, mice were put on the scent. It is believed that in some of the places examined there were as bad furnaces as could well be found anywhere. Not infrequently the disagreeble "close" character of the air was very striking. In short, it is believed that the examination was as thorough as it is possible to make it. The result of the examination is simply this, that *carbonic oxide was not detected in a single case, and the conclusion is justified that in rooms heated by cast-iron stoves and furnaces there is not present in the immediate vicinity of the hot-air flues as much as 0.04 per cent. of carbonic oxide.*

This result is in accordance with those reached by Vogel, by Gottschalk, and by Wolffhügel, referred to in the earlier part of the report, and cannot be disregarded in any future discussion of the question under consideration.

Another question remains to be answered, and that is, whether carbonic oxide in smaller quantities than those which can be detected by Hempel's method may not be present. There is not, however, any reliable method for detecting smaller quantities, so that the question is as yet unanswerable. It is also very difficult to decide whether such small quantities of the gas are injurious to health or not. I have not undertaken any experiments on this point. Those who have discussed it differ in their opinions.

H. Vogel thinks that any quantity of carbonic oxide which cannot be detected by his original method cannot be dangerous. He says: "When the air of a room, containing a very small quantity of carbonic oxide, has not the power to react on the very dilute blood used, this air also has no power to poison the much more concentrated blood of the human lungs. The large quantity of oxygen acts as a natural antidote, and I consider the presence of smaller quantities of carbonic oxide in the air than 2.5 parts per thousand as decidedly not injurious. Indeed, it is possible that the human organism may be able to endure even a larger quantity, for it is a fact that in tobacco smoke, which is inhaled by millions, carbonic oxide can be easily detected by means of the blood-test, and, judging by the strength of the reaction, the gas is present in the smoke in larger quantity than 2.5 parts per thousand. It is probable that the harmfulness of small quantities of carbonic oxide has been overestimated."

Wolffhügel accepts Vogel's view, and suggests this guide for sanitarians, that as long as air does not contain enough carbonic oxide to be detected by Vogel's test (that is, 2.5 parts per 1,000), it may be regarded as uninjurious.

On the other hand, von Fodor takes quite a different view of the matter. According to his experiments, when air contains 1 parts of the gas in 1,000, rabbits become unconscious in it in four hours; if 3 parts are present the effect is reached in 24 hours, and even with 1.3 parts decided symptoms are produced when the air acts for several days on the organism. But man is more sensitive to the action of carbonic oxide than animals, as Friedberg has shown in his treatise, "Vergiftung durch Kohlendunst" (Berlin, 1866), and as follows from the fact that animals easily recover from unconsciousness, whereas

*Vierteljahresschrift für öffentliche Gesundheitspflege, and Dingler's Polytechnisches Journal, 1880, 377, CCXXXIX, 456.

human beings usually die if they once lose consciousness. . . . Further experiments with rabbits showed that even 0.5 parts per 1,000 of carbonic oxide causes difficulty in breathing; the animals staggered and took no food, and were sleepy when the quantity of the gas was reduced to 0.25 parts, so that in this dilution it must be regarded as injurious to health. The views of von Fodor may be summed up briefly, thus: As 1.5 parts of carbonic oxide per 1,000 of air are dangerous to health, 0.5 parts, when inhaled for considerable time, are injurious, and 0.04 parts are not without influence, it is desirable that the heating apparatus and gas pipes in public institutions and private dwellings should be examined with reference to the question whether they permit carbonic oxide to enter into the air used for breathing.

To decide between these widely differing opinions is not part of the work which I originally had in mind. It does not, indeed, belong to a chemist to deal with such matters. The only point I would make in this connection is that it is better to err on the safe side, if err we must. If carbonic oxide can be detected by any method in the smallest quantities in air to be used by human beings, measures should be taken to prevent its further presence.

The cases thus far experimented upon are such as were actually met with in occupied buildings. While the uniformly negative results made it appear probable that experiments with any specially constructed stoves would also yield negative results, I thought it desirable before closing the investigation to test the matter somewhat further. Through the kindness of Messrs. Hutchinson Brothers, manufacturers of furnaces in this city, I was furnished with a stove of peculiar construction for the purpose of further experiments.

Since the investigation of the French commission, in which a cast-iron stove was used, no experiments except those of Wolffhügel have been made on stoves specially constructed for the purpose of determining whether carbonic oxide passes through cast iron heated to redness or not. As the method of detection used by the French commission is not infallible, and as that used by Wolffhügel is not as delicate as the one used in this investigation, it was thought that possibly the use of the more delicate method might show that the gas really does pass through, as stated by the French commission, though denied by Wolffhügel. Two kinds of experiments were performed: 1st. Those in which the air examined was drawn from the top of the stove consisting of cast iron heated to redness; and 2d. Those in which the air was taken from a space on the side of the stove in direct contact with the hot coal.

The stove used is a simple cylinder of wrought iron about two feet high and one and a half feet in diameter. It is so arranged that it can be filled with coal, and the supply of air regulated with ease. The top is a piece of cast iron carefully fitted to the cylinder by an air-tight joint. At the side of the cylinder is a space about six inches square furnished with carefully made grooves, into which plates of cast iron of different thickness may be placed, and fitted in air tight, if necessary, with luting.

Experiment 1. The stove was heated to as high a temperature as possible, so that the top of cast iron was nearly all white hot. The temperature was kept about the same throughout the experiment, the dampers being closed the greater part of the time. A metallic funnel was brought down close to the hot plate; this was connected by rubber tubing with a glass U-tube placed in water for the purpose of cooling the air; then connection was made with the double funnel containing the mouse, and by means of an aspirator air was slowly drawn through the whole system. Twenty liters were drawn through in one and a quarter hours. The mouse was killed and the blood immediately examined, but the spectroscope failed to reveal the presence of any carbonic oxide.

Experiment 2. The same stove was used as in the last experiment, but a piece of cast iron ⅝ inch in thickness was introduced so as to form part of the side of the stove. The coal in the stove was above the top of the cast-iron plate, and the plate was kept considerably above red heat during the experiment. The funnel was applied to this plate and the experiment was, in other respects, conducted the same as the last one. No evidence of the presence of carbonic oxide was obtained.

Experiment 3. Same as Experiment 2 except that the cast-iron plate used was thinner, being from ¼–½ of an inch thick. The space from which the air was drawn was white hot. No carbonic oxide found. Special precautions were taken to prevent the mouse from breathing fresh air in the brief interval from the time the passage of air was stopped until the mouse was killed, which was of course as soon as possible. On stopping the aspirator, both ends of the Hempel funnel were closed; one end was then connected with the hydrant and the air displaced by water.

Experiment 4. Same as Experiments 2 and 3. The plate in this case was $\frac{1}{16}$ of an inch in thickness. No carbonic oxide found.

All these experiments, then, it will be seen, give negative results, and show that under apparently the most favorable conditions not as much as 0.04 per cent. of carbonic oxide passes through heated cast iron.

In view of the accumulating mass of testimony, of which this report furnishes a part, against the correctness of the conclusion first authoritatively stated by the French commission, it appears to be highly desirable that the work of the commission should be repeated, account being taken of the influence of the possible sources of error to which attention was called in the first part of the report. The work would be tedious and would require the greatest possible care, but the importance of the question involved would justify the necessary expenditure of time. If this work were repeated it might be possible to discover what the real cause of the bad effects of furnace air is.

In conclusion, I will only say that, in view of the results reached in these experiments, and those of some earlier experimenters which have been referred to, the confident references to carbonic oxide as a source of danger to health in rooms heated by hot-air furnaces and cast-iron stoves, which we so frequently hear, certainly should be modified to accord with what is actually known. The hypothesis is perhaps justifiable that carbonic oxide is present in such rooms, but not that it is present in quantities as great as 0.04 per cent.; and it remains to be shown whether such minute quantities of the gas, if present, can act injuriously on the health of those who breathe it.

PROPOSED SANITARY LEGISLATION IN GEORGIA.

DEAR SIR: Your careful attention is requested to the subjoined bill and to the resolutions of the Medical Association of Georgia in relation thereto.

The enactment of similar laws in other States, and the practical absence of all regulation of the practice of medicine in this State, makes our cities and towns the common refuge for all kinds of irregular and unlawful practitioners and unprincipled and irresponsible pretenders.

The time has come when the people, as well as the medical profession, require protection, such protection as it is believed will be afforded by the passage of the proposed bill.

It is not the purpose of the bill to interfere with any person whomsoever now lawfully engaged in the practice of medicine within the State.

It merely proposes—

1st. To establish one central board that shall have the power to confer licenses and to determine the legality or illegality of all foreign diplomas.

2d. That all persons now practicing, or who may hereafter engage in the practice of medicine, shall register in the county clerk's office.

3d. That after the passage of the act no one shall commence the practice of medicine within this State without (1) either a license from the board, or (2) a diploma from a chartered college within the State, or (3) a diploma from a chartered college without this State and indorsed by the board as genuine and legally conferred.

It is believed that the bill is equitable and just in all of its provisions, and that it will prove of great and lasting benefit to the medical profession and to the State. You are, therefore, urgently solicited to use your personal influence with the representatives in the general assembly from your county in favor of its enactment.

It will be esteemed a special favor if you will communicate the result of your interviews with your representatives, and with the senator from your district, to either of the undersigned at the earliest practicable moment.

Yours, truly,

H. V. M. MILLER, Atlanta,
JOSEPH P. LOGAN, Atlanta,
W. H. HALL, Milledgeville,
ROBERT BATTEY, Rome,
JNO. THAD. JOHNSON, Atlanta,
E. L. CONNALLY, Atlanta,
JAMES B. BAIRD, Atlanta,
Committee.

JUNE, 1881.

The bill was presented at the recent meeting of the State Medical Association, in Thomasville, and, on motion, was referred to the undersigned committee for investigation and report. The following is the report of the committee, which was promptly adopted:

THOMASVILLE, GA., *April* 21, 1881.

To the Medical Association of Georgia:

GENTLEMEN: Your committee, after a careful scrutiny and analysis of the accompanying bill, heartily approve its provisions, with the amendments suggested thereto, and respectfully recommend the adoption of the following resolutions:

Resolved, That the Medical Association of Georgia emphatically indorse the above bill and earnestly request for it the support of the medical profession and the influence of every physician within this State to secure its enactment.

Resolved, That a committee of seven members of this association—five of whom shall reside in Atlanta—be appointed to superintend its passage through both houses of the general assembly.

W. H. HALL,
T. H. KENAN,
J. T. JOHNSON,
K. P. MOORE,
JAS. B. BAIRD,
Committee.

A bill, to be entitled An act to establish a Medical Board, to prescribe its purposes, powers and duties, and to regulate and improve the practice of medicine in the State of Georgia, and to provide a penalty for the infringement of the same.

SECTION 1. *The General Assembly of the State of Georgia do enact,* That within sixty days after the passage of this act the governor shall appoint nine legally qualified physicians of skill and experience, who shall have been regular graduates of medicine and practitioners of not less than ten years, one from each Congressional district in this State, who shall constitute a board of medical examiners, to be called the "Medical Board of the State of Georgia"; five members of which, at any regular, called, or adjourned meeting, shall constitute a quorum for the transaction of business.

SEC. 2. That the said nine physicians so appointed shall hold office, as such medical examiners, respectively, for the terms following, namely, three for two years, three for four years, and three for six years, and until their successors are appointed and qualified. After the appointment of said nine physicians, as aforesaid, they shall meet in the office of the Secretary of State, upon notice from him of the day of meeting, and shall proceed, under his direction, to determine, by lot, which of them shall hold, for the respective terms of two, four, and six years, the said office of medical examiner. Immediately, and before entering upon the duties of said office, they shall take the oath prescribed for State officers by the constitution of this State, and shall file the same in the office of the secretary of state, who, upon receiving the said oath of office, shall issue each of said examiners a certificate of appointment for his respective term of office, so determined as aforesaid; upon receiving which they shall severally be and become medical examiners, and shall possess and exercise the power and perform the duties of said board, as defined in this act.

SEC. 3. That the term of office of said medical examiners, after the expiration of the terms aforesaid, shall be six years, and they shall be appointed by the governor. Any vacancies that may occur, by reason of death, removal from office, or otherwise, shall be filled in like manner.

SEC. 4. That immediately after the nine appointed medical examiners shall have taken the oath of office, as above provided, they shall meet and organize as a medical board by electing one of said board to be president, and by appointing a proper person, who shall be a legally qualified physician, to be secretary and treasurer of said board, and the successive presidents of said board shall be annually elected by said board from the members thereof. The duties of the president shall be prescribed by the rules or by-laws of said board. The secretary shall continue in office, as such, for six years, or until removed by the election of a successor, or otherwise. He shall be executive officer of said board, and shall perform such duties as said board may determine. He shall reside at the capital of the State, and by virtue of his election as secretary shall be a member of said board, and enjoy all the rights and privileges and exercise all the functions of a member otherwise appointed.

SEC. 5. That said board shall meet at least once every twelve months, at the capital, and may also hold special meetings as frequently as the proper discharge of its duties shall require; the same to be convened by order of the president, and the rules or by-laws shall provide for the giving of proper notice of all such meetings to the members of the board and to the public.

SEC. 6. That it shall be the duty of said board to faithfully examine all persons who may apply to them for that purpose, which examination shall embrace anatomy, physiology, pathology, clinical medicine, surgery, medical chemistry, obstetrics, and therapeutics; *Provided*, If any applicant shall express an intention to practice any exclusive system of medicine, then the examination in therapeutics shall be omitted, but in lieu thereof the applicant shall adduce a certificate of proficiency from a respectable practitioner of said exclusive system, which shall be accepted by the board, if deemed genuine, as satisfactory evidence of his qualification in that branch.

SEC. 7. That said board shall issue to all such persons over twenty-one years of age, believed to be of good moral character, who shall pass satisfactory examinations as herein provided, a certificate, which certificate shall be regarded as a license to practice medicine within this State upon compliance with the subsequent sections of this act.

SEC. 8. That it shall be the duty of said board to examine the diplomas of all graduates of medical colleges, medical schools, or universities without this State, who may desire to commence the practice of medicine within this State, and who may present said diplomas for examination, and to indorse such as have been lawfully conferred.

SEC. 9. That, in the intervals of the sessions of the board, any member of said board may indorse diplomas and license applicants, within his district, as herein provided; but such indorsement and license shall not be valid after the next subsequent meeting of the board, and shall not be given by any member of the board after the applicant shall have had an opportunity of applying to said board or after the refusal of said board to license or indorse.

SEC. 10. That every application for examination by said board shall be accompanied by a fee of thirty dollars, and every application for an indorsement of a diploma by a fee of twenty dollars, to be paid into the treasury of said board; but if a temporary license or indorsement of a diploma is given, as provided in this act, the member of the board granting the license or indorsement shall be entitled to a fee of ten dollars to be paid into the treasury of the board.

SEC. 11. That all moneys due the board shall be paid into the hands of the treasurer of said board, who shall, after deducting the necessary expenses of the board, and not more than two hundred dollars per annum as extra compensation for the secretary, divide the balance equally, share and share alike, among the members of said board.

SEC. 12. That the board may establish such rules and regulations, from time to time, as may be deemed necessary to insure the faithful execution of the provisions of this act.

SEC. 13. That no person shall practice medicine within this State unless he is twenty-one years of age, and either has been heretofore legally authorized so to do, or shall be hereafter authorized so to do as prescribed by this act.

SEC. 14. For the purposes of this act, the words "practice medicine" shall mean to suggest, recommend, prescribe or direct for the use of any person any drug, medicine, appliance, apparatus or other agency, whether material or not material, for the cure, relief, or palliation of any ailment or disease of the mind or body, or for the cure or relief of any wound, fracture, or other bodily injury, or any deformity, after having received, or with the intent of receiving therefor, either directly or indirectly, any bonus, gift, or compensation.

SEC. 15. That every person now lawfully engaged in the practice of medicine within this State shall, on or before the first day of December, eighteen hundred and eighty-one, and every person hereafter duly qualified to practice medicine, shall, before commencing to practice, register in the clerk's office of the county wherein he resides and is practicing or intends to commence the practice of medicine, in a book to be kept for the purpose by said clerk, his name, residence, and place of birth, together with his authority for practicing medicine as prescribed in this act. The person so registering shall subscribe or verify, by oath or affirmation, before a person duly qualified to administer oaths under the laws of this State, an affidavit containing such facts, and whether such authority is by diploma or license, and the date of the same, and by whom granted, which shall be exhibited to the county clerk at the time of registering, and which, if willfully false, shall subject the affiant to conviction and punishment for perjury. The county clerk to receive a fee of twenty-five cents for each registration, to be paid by the person so registering.

SEC. 16. That any person who violates either of the three preceding sections of this act, or who shall practice or offer to practice medicine, without lawful authority or under cover of a diploma or license illegally obtained, shall be deemed guilty of a misdemeanor, and on conviction shall be punished by a fine of not less than one hundred dollars or more than five hundred dollars, or by imprisonment for not less than thirty or more than ninety days, or both. The fine, when collected, shall be paid, the one half to the person, persons, or corporation making the complaint, the other half into the county treasury.

SEC. 17. That a person coming into this State from without the State may be licensed to practice medicine within this State in the following manner: If he has a diploma conferring upon him the degree of Doctor of Medicine, issued by an incorporated medical college, medical school, or university without this State, he shall personally exhibit the same to the Medical Board of the State of Georgia, with satisfactory evidence of his good moral character, and such other, if any, of his qualifications to practice medicine as said board may require. If his diploma and qualifications are approved by them, then they shall indorse said diploma, which shall make it, for the purpose of his license to practice medicine within this State, the same as if issued by them. The applicant shall pay to said board the sum of twenty dollars for such examination and indorsement. This indorsed diploma shall authorize him to practice medicine within this State after he shall have complied with section fifteen of this act.

SEC. 18. That the degree of Doctor of Medicine lawfully conferred by any incorporated medical college, medical school, or university in this State shall be a license to practice medicine within this State after the person to whom it is granted shall have complied with section fifteen of this act.

SEC. 19. That nothing in this act shall apply to commissioned medical officers of the United States Army or Navy, or of the United States Marine Hospital Service, or to legally qualified dentists practicing their professions, or to any woman practicing only midwifery.

SEC. 20. That it shall be the duty of the honorable judges of the several superior courts of this State to give this law in special charge to the grand juries of their respective circuits.

SEC. 21. That all acts or parts of acts inconsistent with the provisions of this act are hereby repealed.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JUNE 11, 1881.

ABSTRACTS FROM CONSULAR REPORTS.

JAPAN.—United States Consul, T. B. Van Buren, under date of May 25, forwards a report of deaths at Yokohama during the month of April. Among the natives there were 115 deaths, of which one was from typhoid fever. The cases noted were, 5 of typhoid fever and 3 of typhus fever. Among foreigners there had been one case of typhus fever, and two deaths occurred from causes not given.

BARBADOES, WEST INDIES.—Under date of May 31, United States Consul W. H. Polleys forwards a circular issued by the Hon. William Robinson, governor of the island, May 27.

In this circular he states that several cases of yellow fever and one death had occurred in Bridgetown during the month of May. The board of health advise that bills of health should have on them a memorandum to that effect, and this recommendation was approved. The fever is not regarded as epidemic, and the island is free from other infectious diseases.

PORTO RICO, WEST INDIES.—United States Consul E. Conroy reports 5 cases and three deaths from yellow fever at San Juan during the month of April. Of small-pox, 42 cases are reported with 22 deaths. The total number of deaths was 106; population, 23,240; annual death-rate 55.5 per 1,000.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, JULY 2, 1881. [No. 1.

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—United States Consul L. A. Price reports that during the month of May there were 17 deaths from small-pox, 2 from typhoid fever, and 28 from other infectious diseases. There were 427 deaths from all causes, giving an annual death-rate of 23.4 per 1,000.

CONSTANTINOPLE.—United States Consul G. H. Heap reports that the plague in Mesopotamia is nearly stamped out. This result, and the limitation of the disease to a comparatively small region, are due to the energy and efficiency of the medical officers employed, and to the ready assistance furnished to them in men and money by the government. The telegrams from Dr. Zilterer, medical inspector, dated May 30, announce that the principal work now required is the prosecution of the sanitary measures necessary to prepare the evacuated towns for the return of their inhabitants. There is, however, no relaxation in the measures for preventing the spread of the pestilence.

GUADALOUPE, WEST INDIES.—United States Consul C. Bartlett reports for the week ending May 28 that 5 cases of yellow fever had occurred, none of which were fatal. The general sanitary condition of Pointe à Pitre is not satisfactory, and malarial diseases are prevalent.

GUAYMAS, MEXICO.—United States Consul A. Willard reports 11 deaths for the month of May; population, 5,500; annual death-rate, 24 per 1,000. No contagious disease is reported.

HOBART, TASMANIA.—United States Consul A. G. Webster reports 55 deaths during the month of March, none of which were from contagious diseases. Population, 27,500; annual death-rate, 23.1 per 1,000.

MELBOURNE, AUSTRALIA.—United States Consul O. M. Spencer reports, for the month of March, 30 deaths from typhoid fever, and 11 from other zymotic diseases. The total number of deaths was 511, and the population being 280,836, the annual death-rate was 25.2 per 1,000.

MOSCOW, RUSSIA.—The report of United States Consul A. Weber shows for the month of February 26 deaths from small-pox, 301 from typhoid fever, and 121 from other infectious diseases. Total number of deaths, 2,128; population, 601,969; annual death-rate, 44.4 per 1,000.

During the month of March there were 17 deaths from small-pox, 356 from typhoid fever, 158 from other infectious diseases, and 2,475 from all causes; annual death-rate, 48.4 per 1,000.

NEW ZEALAND.—The report of the registrar-general for the month of March gives a total of 103 deaths in 5 of the principal towns, having an aggregate population of 75,720; annual death-rate, 16.3. per 1,000. There were 42 deaths from zymotic diseases, of which 29 were from diarrhœa and dysentery. Consumption and acute lung diseases caused 8 deaths each.

RIGA, RUSSIA.—United States Consul P. Bomholdt reports 194 births and 312 deaths for the month of April. Among the causes of death were: consumption, 41; pneumonia, 24; croup, 12; small-pox, 32; typhoid fever, 10; scarlet fever, 8; measles, 5; diphtheria, 5; whooping-cough, 3. It is remarkable that only one death is recorded as due to diarrhœa.

SANDWICH ISLANDS.—United States Consul D. A. McKinley sends the official report for the month of May, showing that in Honolulu there were 98 deaths, of which 24 were under 5 years. Small-pox caused 32 deaths, dysentery 9, dropsy 3, consumption 4, and 10 are ascribed to old age.

SINGAPORE.—United States Consul A. G. Studer reports that up to May 9 his district continues free from contagious or infectious diseases.

ST. JOHN'S, NEWFOUNDLAND.—Under date of June 18 United States Consul T. N. Molloy reports that the government of Newfoundland has discontinued the quarantine regulations at that port, which were announced in a dispatch of May 18.

SYDNEY, AUSTRALIA.—The report for the quarter ending March 31, for this city and its suburbs, gives a total of 2,115 births and 1,237 deaths. Among the causes of death contagious and zymotic diseases do not hold a prominent place, and the report indicates a good general sanitary condition.

TAMPICO, MEXICO.—United States Consul A. J. Cassard, under date of June 18, states that since the yellow-fever epidemic of 1878 and 1879 this port has been entirely free from infectious diseases. This exemption is not due to any sanitary work or precautions on the part of the authorities, and it is to be noted also that Tampico is in constant communication, without any quarantine restrictions, with Vera Cruz, where yellow fever may be considered endemic. No reliable reports of births and deaths can be obtained, as no official record is kept.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

SAINT MARY'S, GA.—Under date of June 19, Dr. A. F. Barnard reports that the town enjoys its usual immunity from contagions and infectious diseases, and that no vessels from infected ports have arrived since his last report. Weather very hot and dry.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JUNE 18, 1881.

States	Cities.	Total population according to the United States census of 1880.	Total number of deaths.	Representing an annual death-rate per 1,000 of—	Population, according to United States census of 1880.		Number of deaths.		Annual death-rate per 1,000.		Population under 5 years. TULLIO S. VERDI, M. D., &c., 815 14th st., N. W., Washington, D. C.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, JULY 9, 1881. [No. 2.

RULES OF THE NATIONAL BOARD OF HEALTH REGULATING QUARANTINE ADOPTED BY THE STATE BOARD OF HEALTH OF SOUTH CAROLINA.

Dr. Henry D. Fraser, secretary executive committee of the State board of health of South Carolina, states, under date of June 29, that at a recent meeting of the executive committee of the State board of health the following resolution was unanimously adopted:

Resolved, That this board adopt the rules of the National Board of Health in relation to quarantine as their rules.

SANITARY EXHIBITION IN NEW JERSEY.

The following circular, issued by the New Jersey State Board of Health, is published for the information of those interested in sanitary household and ornamental articles and appliances. The exhibition will be opened on the 19th of September next, near Newark, N. J., and in view of its great importance it should receive the earnest co-operation of sanitarians throughout the country:

TRENTON, N. J., *July* 1, 1881.

HOME AND FOREIGN CIRCULAR OF THE NEW JERSEY STATE BOARD OF HEALTH AS TO SANITARY HOUSEHOLD AND ORNAMENTAL ARTICLES AND APPLIANCES.

In the practical applications of sanitary science, it has become necessary to use very many appliances, both for convenience and to guard against evils incident to household and city life. These inventions have become far more numerous and useful than is generally known. To afford the people a better opportunity to become acquainted with their merits, both by personal examination and by the opinion of experts, the State Fair of New Jersey and the State Board of Health in 1879 united in an exhibition of sanitary appliances. Although it was the first of the kind attempted in this country, it was so highly successful as to lead us to make it a permanent and prominent feature at this great annual gathering of our citizens. This fair is held for a week each year, only a few miles from New York City, near Newark, and on the direct route to Philadelphia and to the South and West. The attendance from this and other States is very large, and it affords the best opportunity for familiarizing the people with valuable improvements. It opens this year September 19.

A special building, supplied with water, is provided, and the actual working of house-systems, ventilators, and various other appliances, can be shown.

It is intended to make this exhibit an attraction at our annual fairs, so that all may become acquainted with the best sanitary arrangements, and inventors and dealers have a good opportunity for comparing and testing apparatus. When necessary the judges will order trial, and postpone award until satisfied.

Specimens, models, or drawings may be sent either as competing for premiums or for exhibit. Every article should bear a descriptive label, containing detailed information respecting its construction, use, retail price, and the place at which it can be obtained. There is no charge for space. Facilities will be afforded for those who desire to show any apparatus in actual working. Articles must bear the name of the owner or agency exhibiting. The small cost of conveying goods to and from the fair must be borne by the exhibitors. Letters of inquiry may be addressed to E. A. Osborn, C. E., Middletown, N. J., or to State Board of Health, Trenton, N. J. Articles sent for exhibit in our care should be directed "New Jersey State Fair, Waverly. Care of New Jersey State Board of Health."

MUSEUM.

The State Board of Health has commenced at Trenton, the capital of the State, a museum of sanitary appliances, to which any owner or manufacturer may present the articles exhibited as the property of the State, for permanent examination and exhibit. Or they will, by us, be directed to the persons or agents with whom they are to be left. Specimens of all new sanitary inventions are solicited.

The following is an abbreviated summary of leading articles, but various other articles will properly come in this department, and be subject to award:

DEPARTMENT K.

Sanitary, household and ornamental.

	Prize.
CLASS 71.—CONSTRUCTION MATERIALS, &C.	
Samples of building-stone, concrete, or other building material.	Diploma.
School-room furniture and appliances	Do.
Pipes, tile, &c	Medal.
Wall-paper and house decorative materials	Diploma.
Sanitary pottery, &c	Do.
Sanitary models for care of animals	Do.
CLASS 72.—HEATING AND VENTILATING APPARATUS.	
For warming houses by flues, steam, or hot water. Best system of each.	Silver medal.
Steam or gas cooking apparatus	Medal.
Stoves for heating or cooking, so as to avoid gas and dust	Diploma.
Chimney cowls and caps	Do.
Specimen ventilators of all kinds	Medal.
CLASS 73.—DRAINAGE AND WATER SUPPLY.	
Drainage plans or sanitary maps	Grand medal.
Specimens of soil and organic matter from "The New Jersey Experimental Station."	Medal.
Water-supply apparatus, as cisterns, flush-tanks, filters, coolers, sinks, &c., best form of each.	Diploma.
CLASS 74.—BATHING APPARATUS AND BATH-ROOM FIXTURES.	
Bath-tubs and connections	Diploma.
Best water-traps and grease-traps	Each a medal.
Dry earth closets	Medal.
Best pan, hopper, and plunger water-closet	Each a medal.
General assortment of plumbers' work and material	Medal.
Gas and other lighting material and fixtures	Diploma.
Electric-light fixtures	Medal.
CLASS 75.	
Druggists' samples, disinfectants	
Preserved foods, health and condensed foods, invalid preparations.	
Refrigerators, food preservers	
Yeast powders	
For selection of each class	Silver medal, medal, or diploma.
CLASS 76.	
Excavating and odorless apparatus, outbuilding models, and miscellaneous sanitary goods.	Medal or diploma.
Other exhibits of sanitary appliances may have medal or diploma as award.	
CLASS 77.	
Life and labor saving apparatus	
Life boats and preservers or life rescue apparatus	Medal.
Health-lifts—gymnasium apparatus	Diploma.
Sick chairs, beds, and other sick-room conveniences	Do.
Invention and appliances for relieving constrained positions or for diminishing health-risk in various industries.	Medal.
CLASS 78.	
Food adulteration and testing apparatus	

Exhibitors are entitled to admission tickets.

The general direction of the department is assigned to E. A. Osborn, C. E., Middletown, N. J., and E. Dunn, 104 Market street, Newark, N. J.

The following persons are in charge of classes and assisted by others in subclasses:

Class 71. Samuel C. Brown, Trenton, N. J.

Class 72.

Class 73. Prof. George H. Cook, New Brunswick, N. J.

Class 74. Mr. Taylor, Newark, N. J.
Class 75. Charles A. Amende, Hoboken, N. J.
Class 76. William K. Newton, M. D., Paterson, N. J.
Class 77. H. A. Hopper, M. D., Hackensack, N. J.
Class 78. William H. Newell, M. D., Jersey City, N. J.

These gentlemen will be aided by a committee of direction, consisting of Amos Clark, jr., President, and William M. Force, Recording Secretary of New Jersey Agricultural Society, No. 764 Broad Street, Newark, N. J.; Hon. Phineas Jones, Newark, N. J.; A. D. Newell, M. D., New Brunswick, N. J.; R. Wescott, M. D., Elizabeth, N. J.

ADDITIONAL FOREIGN CIRCULAR.

It is also our desire to secure from foreign inventors and dealers specimens of the most approved appliances. It is the best opportunity that can be afforded in this country for extending their sale. Already the foreign press has noticed some valuable features of our former exhibits. No pains will be spared to do full justice to each article sent. Any articles sent will either be placed in the museum or disposed of as otherwise ordered. Persons wishing to establish agencies in this country will be directed to responsible agents, who can furnish full reference. Any articles sent to our care, prepaid, may be consigned through Morris' Express, 50 Broadway, New York, or as freight through other agents. Expenses of transfer from the New York agency to the fair grounds will be paid for here. We can assure exhibitors of careful attention to the merits of each article.

By order of the State Board of Health.

E. M. HUNT, M. D., *Secretary.*

P. S.—During July and August of 1881 the Secretary may be addressed care of Trubner & Co., 58 Ludgate Hill, London, and special arrangements can be made for the receipt or conveyance of exhibits to the United States.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY.—United States Consul W. L. Goldsborough reports, under date of May 21, the prevalence of measles and small-pox, chiefly among the native population. The officially estimated population of the city is about 300,000, and in the absence of drainage and cleanliness the sanitary condition of the city is very bad.

BRIDGETOWN, BARBADOES.—United States Consul W. H. Polleys reports 2 cases of yellow fever as having occurred on board a vessel in that port during the month. The health authorities, however, have declared the island otherwise free from infectious or contagious diseases. The total number of deaths during the month among a population of 20,000 was 76.

CAYENNE, GUIANA.—United States Consul P. Decomis, under date of May 16, reports that the town is healthy, and that there is reason to hope that the country will soon be entirely free from yellow fever.

CONSTANTINOPLE.—United States Consul-General G. H. Heap reports, under date of June 11, that the plague which has been making such ravages at Bagdad, on the lower Euphrates, has almost wholly disappeared. The number of deaths occurring daily has diminished steadily from 56 on May 2 to 2 on June 2. During the last ten days of May all the well were removed from the town and placed in camps. Only those who were already stricken were left in the place. Among these and in the town generally the work of disinfection is being actively pursued.

FOOCHOW, CHINA.—Reports received from United States Consul J. C. Wingate to May 14 state that the sanitary condition of the city is bad in consequence of defective drainage. The streets, as also the habitations of the natives, are generally filthy.

GHENT, BELGIUM.—Reports from United States Vice-Consul A. Lefebver give a total of 288 deaths from all causes during the month of May in a population of 134,852, or an annual death-rate per 1,000 of 25.6.

Among the deaths recorded he reports the following: From consumption 54, bronchitis 56, diarrhœal diseases, 44, heart disease 26, and apoplexy 18.

GUADALOUPE, WEST INDIES.—United States Consul Charles Bartlett, under date of June 4, reports that no cases of yellow fever had occurred at Pointe à Pitre within ten days, but two had been reported from Basse-Terre. The authorities had resumed the issue of clean bills of health, but Mr. Bartlett decided to wait ten days longer, in order to observe if the fever should reappear. This event he considered not improbable if rain should fall for some days, as the late hot and dry weather was most favorable to the checking of the fever.

MALTA.—The report of United States Vice-Consul C. B. Eynaud for the two weeks ending May 31 gives a total of 139 deaths in a population of 154,830, distributed as follows: From zymotic diseases 16; constitutional, 21; local, 70; developmental, 29; and from violence 3.

MARACAIBO, VENEZUELA.—Reports from United States Consul E. H. Plumacher, for the two weeks ending June 11, state that yellow fever is slowly increasing, though it has not yet assumed an epidemic form. The mortality has been greatest among those recently arrived from Europe.

The city and district was visited by a plague of locusts on May 28, which continued for several days. Great numbers of the insects are still lying dead about the streets and in the water cisterns, polluting the waters and poisoning the atmosphere with the offensive effluvia. Numerous cases of fever and dysentery, resulting fatally in some instances, have been caused by these conditions. The gravest apprehensions are entertained unless energetic measures are adopted by the authorities to improve the sanitary condition of the city.

MARSEILLES.—The report of United States Consul J. Martin, for the month of May, gives a total of 704 deaths, of which 8 were from small-pox, measles 6, typhoid fever 24, croup 27, scarlet fever 1. Annual death-rate 26 per 1,000.

MELBOURNE, AUSTRALIA.—United States Consul-General O. M. Spencer forwards report of government statist on the vital statistics of Melbourne and suburbs, March, 1881. The deaths registered in March numbered 511 in a population of 280,836, giving an annual death-rate of 21.85 per 1,000.

The deaths of children under five years of age numbered 221, of which 161 were under one year.

The causes of death are classified as follows:

From zymotic diseases 137, among which are mentioned scarlatina 5, diphtheria 4, croup 4, typhoid fever 30. Constitutional diseases 89, of which number 55 died from phthisis. Local diseases 177. Developmental diseases 83. Violent deaths 24.

NASSAU, N. P.—United States Consul T. J. McLain, jr., reports for the week ending June 4 the health of the city excellent. Population 12,000. No deaths reported.

PORT LOUIS, MAURITIUS.—Reports received from United States Consul T. T. Prentiss for Port Louis and the rural districts during the quarter ending March 31, 1881 give a total of 2,469 deaths, of which 1,318 were caused by fever.

The annual death-rate per 1,000 during the above period was 27.44.

The entire period is regarded as having been very unhealthy. Rain storms, followed by high temperature, were very frequent, and the cases of malarious fever were more than usually numerous and severe. During the month of March, out of a total of 1,020 deaths, 605 were from fever.

SAN JUAN, PORTO RICO.—United States Consul Edward Conroy reports that during the month of May the total number of deaths was 81, of which 6 were from yellow fever and 6 from small-pox.

SANTANDER, SPAIN.—In this province, of 41,021 inhabitants, the report for the first 3 months of 1881 shows a total of 415 deaths, giving an annual death-rate of 40.5 per 1,000. Of the decedents, 194 were under 5 years of age and 62 were over 60 years. Among the causes of death were: Small-pox 1, measles 1, scarlet fever 2, diptheria and croup 12, whooping-cough 3, typhus fever 6, dysentery 6, consumption 48, acute lung diseases 46, diarrhœa 13. The births during the quarter were 463, and the annual birth-rate 45 per 1,000.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

DEMERARA, BRITISH GUIANA, July 6, 1881.—An official telegram reports the existence of yellow fever at this place.

FORT SULLY, DAK.—Surgeon B. F. Pope, United States Army, writing under date of June 28, reports the appearance of measles at the post on May 23. The original cases were imported, and he notes as a matter of interest that the period of incubation was exactly 15 days. Seven cases have occurred. The disease, however, is of a mild type, and none of the cases have resulted fatally.

HAMILTON, OHIO.—Under date of May 30 Dr. C. A. G. Reed reports an epidemic of measles, which has interfered with the attendance at public schools. The disease is of mild type, and has caused no deaths as yet.

HAVANA, CUBA.—During the week ending June 24 fifteen deaths occurred from yellow fever, of which 11 were among the military. The disease is slowly increasing, and the crews of three merchant vessels at wharves have been affected during the past ten days. The weather being hot and rainy, the fever will probably increase. Small-pox caused 20 deaths during the week.

MINSTER, OHIO.—Under date of June 27 Dr. E. F. Wells reports that the town and vicinity are in good sanitary condition, and that no endemic or epidemic disease prevails.

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

The following order has been issued by the board of health of Memphis, Tenn.:

HEALTH ORDER NO. 3.

OFFICE BOARD OF HEALTH,
TAXING DISTRICT, SHELBY COUNTY, TENNESSEE,
Memphis, June 30, 1881.

As a measure of precaution in the interest of the public health of the city of Memphis, it is hereby ordered that no boat or water craft of any description arriving at this port from below, shall land any articles of the class commonly known as junk stores, such as rags, paper stock, old rope, second-hand clothing, bedding, and upholstered furniture, nor shall any other freight which may have been carried in contact with such articles, nor any person from such boat, be allowed to land or be landed at this port. The above class of merchandise should be shipped in sealed barges past this port for the next ninety days. This order shall take effect from and after July 10, proximo.

J. H. PURNELL,
Acting Secretary Board of Health.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, JULY 16, 1881. [No. 3.

ABSTRACTS FROM CONSULAR REPORTS.

BAHIA, BRAZIL.—United States Consul A. C. Prindle reports that the British bark Burmah, infected with yellow fever, sailed for New York on the 18th ultimo. This vessel had previously left port for New York about the last of May, but put back, the captain having been taken with yellow fever. He was treated in hospital and recovered. Yellow fever does not exist in Bahia as an epidemic, the city and harbor being generally in a healthy condition.

MESSINA, SICILY.—United States Consul George H. Owen reports that during the months of February and March there were 457 deaths, of which 17 were from typhoid fever and 88 from other contagious or infectious diseases. The prevailing diseases were diphtheria, scarlet fever, bronchitis, and consumption.

NASSAU, N. P., BAHAMAS.—United States Consul T. J. McLain, jr., reports for the two weeks ending June 18 the prevalence of malarial fevers and dysentery. These diseases generally prevail in the summer. During the present season the cases have generally been mild, and few deaths have occurred. The sanitary condition of Nassau is good, the city being clean, well drained, and the board of health is efficient and careful.

SANTA CRUZ, CANARIES.—Reports received from United States Consular Agent F. W. Lavers for the months of March, April, and May show a total of 29 deaths for the quarter in a population of 6,631, or at the rate of 17.49 per 1,000 per annum. The sanitary condition of the city is good, and it is entirely free from contagious or infectious diseases

SINGAPORE.—United States Consul A. G. Studer states, under date of May 23, that there have been no appearances of epidemics or contagions or infectious diseases in that port or the adjacent country within the limits of his consulate since his last report. He also forwards the statement of the registrar-general for the month of April, which gives a total of 366 deaths during the month; of which the principal causes of death were the following: Consumption, 44; fevers, 72; diarrhœal diseases, 73; venereal diseases, 37; leprosy, 13; and beri beri, 9.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

ARKANSAS.—Dr. J. A. Dibrell, jr., secretary of the new State board of health of Arkansas, forwards the following communication, dated July 6, 1881:

At a meeting of the State board of health of Arkansas, held in Little Rock July 1, 1881, resolutions of the Tennessee State board of health adopted April 6, 1881, inviting the co-operation of State and National health authorities in matters pertaining to the public health, and recommending that the National Board place "inspecters" wherever deemed necessary for mutual protection against the invasion of epidemic and infectious diseases, and resolutions of the Illinois State board, to the same purport, were fully approved and concurred in by this board.

I am also instructed to notify the secretary of the National Board that the "Rules and Regulations" of the same have been formally adopted by this, the new State board of Arkansas.

J. A. DIBRELL,
Secretary State Board of Health of Arkansas.

BURLINGTON, VT.—Dr. George M. Ockford reports, under date of July 10, that the health of Burlington has been good during the past three months. Pneumonia was prevalent during the spring. Among the epidemic diseases whooping-cough is of most frequent occurrence. Occasionally cases of scarlet fever have appeared, but these have generally been mild in form. The diarrhœal diseases incident to the warm season have also been of simple variety and of short duration.

CANNELTON, IND.—Dr. Thad. M. Stevens, secretary of the State board of health, forwards a report of Dr. C. H. Beard, concerning cerebro-spinal meningitis at Cannelton. He states that the disease made its appearance about the middle of April last, and that there were five well-marked cases. During the prevalence of the disease a number of persons were affected with severe pains in head and spine, attended with febrile symptoms to a greater or less degree.

Of the persons attacked three were males and two females, all of whom were young, ranging from 17 to 26 years. Four died; the fifth, a young man, was removed from the town and was not afterwards heard from.

CEDAR KEYS, FLA.—A board of health has been organized at Cedar Keys, under the law passed at the last session of the legislature, with the following membership: G. H. Richards, W. H. Anderson, F. E. Hale, R. H. McIlvaine, M. D., A. J. Woodward, M. D., E. J. Lutterloh, mayor, and Wm. Batty.

Each householder has been served with notice to put his premises in good sanitary condition at once by burning or removing all rubbish and disinfecting all closets with dry earth or copperas so as to destroy all odors.

DUBLIN, IRELAND.—The report of Dr. Charles A. Cameron, F. R. C. S. I., medical officer of health, shows a total of 510 deaths in the city of Dublin during the month of May, 1881. The deaths within the municipal area were in the annual ratio of 27.05 per 1,000. The death rate in the northern portion of the city was 28.4 and in the southern portion 25.95 per 1,000. The deaths from the seven principal zymotic diseases were in the ratio of 2 per 1,000. In this division, as in the ratio for the entire city, the deaths in the northern portion appear above the general average, being 2.15, while in the southern portion the ratio is again below the average, being 1.9 per 1,000. The total number of deaths from all zymotic diseases during the month was 67; of which number 17 died of typhoid fever, 15 of typhus fever, 3 of scarlet fever, 4 of whooping-cough, 1 of small-pox, and 1 of diphtheria.

FREETOWN, SIERRA LEONE.—United States Consul J. A. Lewis reports 54 deaths during the month of April; population, 21,931; annual death-rate per 1,000, 29.5. The prevailing disease is rheumatism, attributed to the dampness of the mud houses occupied by the majority of the people. Acknowledgment is due to Dr. Robert Smith, colonial surgeon, for furnishing the consul with the record of deaths registered in his office.

HAVANA, CUBA.—During the month ending June 30, there were 744 deaths from all causes. Of this number 39 died of yellow fever, 25 of pernicious fever 28 of typhoid fever, and 84 of small-pox. During the week ending July 1, there were 15 deaths from yellow fever, with about 50 cases of the disease in the city July 1. The disease is increasing, and a few merchant vessels have already been invaded by it at wharves where proper care has not been given to their sanitary condition.

SAN ANTONIO, TEX.—Dr. R. Menger furnishes the following mortality report for the month of June:

Total deaths from all causes, 70; population, 20,561; annual death-rate per 1,000, 40.8.

Of the decedents, 25 were under 1 year; 17 from 1 to 5; 3 from 5 to 10; 3 from 10 to 20; 6 from 20 to 30; 6 from 30 to 40; 3 from 40 to 50; 2 from 60 to 70; 4 from 70 to 80; and 1 105 years old.

The causes of death were as follows: Zymotic diseases, 18; nervous, 9; respiratory, 7; measels, 3; typhoid fever, 1; diarrhœa, 4; dysentery, 2; cholera infantum, 7; malarial fevers, 3; phthisis pulmonalis, 4; pneumonia, 3; scrofula, 2; heart disease, 4; gastritis and enteritis, 6; intestinal obstruction, 1; diseases of the liver, 1; Bright's disease, 1; premature birth, 1; teething, 2; general debility, 1; still-born, 3; drowning, 1; old age, 1; congestion of brain, 9; syphilis, 2; suicide, 1.

WILMINGTON, DEL.—Dr. E. B. Frazer, city registrar, reports the continued prevalence of the epidemic of small-pox in Wilmington. The disease made its appearance in January last, since which time about three hundred cases have been reported. The greatest number reported in one day occurred July 4, 16. During the next seven days 45 cases were reported. The instructions issued by the board of health regarding disinfection are full and clear, both as to the disinfectants recommended for use and the manner of using them.

REPORT OF MORTALITY IN CITIES OF THE UNITED STATES FOR THE WEEK ENDING JULY 2, 1881.

The following statement of an American shipmaster, in relation to the manner in which certificates of inspection, &c., are furnished to vessels sailing from Rio de Janeiro for ports in the United States, is published for the information of quarantine officers and others:

Soon after beginning to take in cargo in Rio de Janeiro, Captain Beck, of the American brig Anita Owen, was asked by the secretary of the United States consul in that port whether he did not intend to have his vessel inspected and fumigated, so as to receive a certificate to that effect, representing that this certificate would be of great service to him on arriving at any quarantine station in the United States. Captain Beck consulted his merchant, Mr. Wright, on the subject, and was told by this gentleman that it was not necessary. However, in order to be sure, the captain called upon Dr. King, the medical man who furnishes the certificate of fumigation and inspection to all vessels bound to the United States whose masters may wish to obtain this document, and found that a fee equal to $35 had to be paid. He asked the doctor if it would make any difference about having a portion of his cargo on board, and was informed that this would make no difference, but that whenever he was ready to go to sea just to call, and that it would be "all right" about the certificate. Captain Beck understanding that the certificate offered would be given *without any actual inspection or fumigation* of the vessel, did not purchase one, and subsequently took occasion to inquire of another captain of the German brig Bolk how he had managed about the certificate. This latter gentleman informed him that he had bought one, and that the doctor was never on board at all, and that no one had ever *pretended* to inspect or fumigate his vessel. Here are the facts as related to me by Captain Beck, and at my request he has attested to the correctness of the affair as here given.

G. FARRAR PATTON, M. D.,
Inspector National Board of Health.

The above statements of what I related to Dr. G. F. Patton are correct in every particular.

FRANK W. BECK,
Master of American brig Anita Owen.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

MASSACHUSETTS.—The report of Dr. H. P. Walcott, health officer, on the mortality of Massachusetts, for the week ending July 2, has been received. The total number of deaths reported from 38 cities and towns in the State, having an aggregate population of 995,510, was 328, or in the ratio of 17.18 per 1,000 per annum. Of the decedents 112 were under 5 years of age. Fifty-three deaths were reported from the principal zymotic diseases, diphtheria and croup 22, and diarrhœal diseases 11. No deaths were reported from small-pox. There were 62 deaths from consumption and 27 from lung diseases. The mortality from diarrhœal diseases is double that of the previous week, a slight increase in that from scarlet fever, and a decrease in that from cerebro-spinal meningitis and typhoid fever.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

The following reports for the week ending July 4, 1881, are from places in which burial permits are not required:

Allegheny, Pa., 79,000; deaths, 49; under 5 years, 39; accident 1, cerebro-spinal meningitis 4, diarrhœa 8, typhoid fever 1, scarlet fever 12, congestion of lungs 1. Bath, Me., 7,875; death, 1; consumption 1. Brattleboro', Vt., 6,000; deaths, 2. Calais, Me., 6,172; deaths, 2; accident 1. Carrollton, Miss., 600; no deaths. Clinton, Mich., 1,200; death, 1. Columbus, Ga., 10,123; deaths, 10; under 5 years 3; consumption 1, diarrhœa 2, puerperal 1. Corinth, Miss., 2,264; deaths, 2, under 5 years; consumption 1, diarrhœa 1. Crystal Springs, Miss., 955; no deaths. Decatur, Miss., 1,000; death, 1. Fayette, Miss., 400; no deaths. Greenville, S. C., 6,510; no deaths. Helena, Mont., 3,630; death, 1; consumption 1. Hernando, Miss., 1,000; deaths, 16; croup 2, diarrhœa 3, erysipelas 1, malarial fever 5, pneumonia 1, bronchitis 3, pleurisy 1. Huntingdon, Pa., 4,500; death, 1. Huntingdon, Tenn., 1,200; no deaths. Iuka, Miss., 816; no deaths. La Salle, Ill., 8,885; deaths, 2; consumption 1, whooping cough 1. Louisiana, Mo.; deaths, 2; diarrhœa 1. Madison, Ind., 8,945; deaths, 8; under 5 years, 6; diarrhœa 2. Martinsburg, W. Va., 6,334; deaths, 2; consumption 2. Milan, Tenn., 1,800; no deaths. Milford, Mich., 1,400; death, 1. Milledgeville, Ga., 3,000; deaths, 2; under 5 years, 2. Muskegon, Mich., 11,300; deaths, 6; under 5 years, 4; scarlet fever 3, measles 3. Painesville, Ohio, 5,504; no deaths. Pass Christian, Miss., 4,000; no deaths. Pearlington, Miss., 1,200; death, 1; under 5 years, 1; malarial fever 1. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; no deaths. Port Royal, S. C., 750; no deaths. Raymond, Miss., 500; no deaths. Rensselaer, Ind., 900; no deaths. Santa Cruz, Cal., 10,000; no deaths. Senatobia, Miss., 935; no deaths. Starkville, Miss., 1,454; death, 1; under 5 years, 1; diarrhœa 1. Tampa, Fla., 740; no deaths. Titusville, Pa., 9,046; deaths, 2; under 5 years, 1; diarrhœa 1. Tuskaloosa, Ala., 2,017; death, 1; consumption 1. Winchester, Va., 5,000; deaths, 3; under 5 years, 2; scarlet fever 2. Youngstown, Ohio, 15,421; deaths, 4; consumption 1, malarial fever 1. Total population, 238,919; total number of deaths, 93; deaths under 5 years, 57; annual rate per 1,000, 20.3.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy. Notice of at least one week should be given when a large number is required.

THE NATIONAL BOARD OF HEALTH.

OFFICERS.

JAMES L. CABELL, LL. D., &c ..... *President.*
JOHN S. BILLINGS, Surgeon United States Army ..... *Vice-President.*
THOMAS J. TURNER, Medical Director U. S. Navy ..... *Secretary.*

MEMBERS.

PRESTON H. BAILHACHE, M. D., U. S. M. H. S., 509 Maple ave., Le Droit Park, Washington, D. C.
SAMUEL M. BEMISS, M. D., &c., 558 St. Charles st., New Orleans, La.
JOHN S. BILLINGS, M. D., U. S. A., 54 Gay st., Georgetown, D. C.
JAMES L. CABELL, M. D., &c., University of Virginia, Va.
CHARLES F. FOLSOM, M. D., 113 Boylston st., Boston, Mass.
HOSMER A. JOHNSON, M. D., &c., 4 W. Sixteenth st., Chicago, Ill.
ROBERT W. MITCHELL, M. D., &c., 34 Madison st., Memphis, Tenn.
SAM'L F. PHILLIPS, Esq., Solicitor-Gen'l, 1119 K st., Washington, D. C.
STEPHEN SMITH, M. D., &c., 31 West Forty-second st., New York.
THOS. J. TURNER, M. D., U. S. N., 1227 M st., Washington, D. C.
TULLIO S. VERDI, M. D., &c., 815 14th st., N. W., Washington, D. C.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, JULY 23, 1881. [No. 4.

EXPERIMENTS WITH DISINFECTANTS.

[By GEO. M. STERNBERG Surgeon U. S. A.]

In experiments previously reported (National Board of Health Bulletin, vol. I, Nos. 29, 30, 37, and 47), the comparative value of certain well-known and commonly-used volatile and gaseous disinfectants was tested. In these experiments vaccine virus was the substance exposed to the action of disinfectants, and the test of disinfection was insertion of the disinfected virus into the arm of an unvaccinated child, virus from the same source not disinfected being inserted at the same time at a different point. A positive result from the non-disinfected virus and a negative result from that exposed to the disinfecting agent was taken as proof of the potency of this agent.

As an additional test some experiments were made upon the bacteria contained in putrid urine, the test of disinfection being the failure to multiply in sterilized urine after exposure to the action of a disinfectant. (See Bulletin Nos. 37 and 47, vol. I.)

The general results of these experiments may be stated as follows:

Chlorine.—In experiments upon vaccine virus, dried upon ivory points, an exposure for six hours in an atmosphere containing 50 volumes to 1,000 of air ($\frac{1}{2}$ per cent.) was found to destroy the potency of the virus. A still smaller quantity ($\frac{1}{4}$ per cent.) was found to destroy the vitality of bacteria dried upon a piece of filtering paper, and it is possible that further experiments would have demonstrated the efficiency of this agent in still smaller quantities.

Nitrous acid gas (generated by pouring nitric acid on copper filings and collected over mercury) destroyed the potency of vaccine virus in the proportion of 1 per cent. (1 volume to 100 of air); time of exposure six hours. The experiments upon bacteria showed this agent to be efficient in the proportion of $\frac{1}{2}$ per cent., but it broke down at $\frac{1}{4}$ per cent. I should, therefore, place the minimum amount which can be safely relied upon to destroy dried films of virus and the bacteria of putrefaction (dried upon filtering paper) at 1 per cent.

Sulphurous acid gas.—This agent was tested in various proportions, and was found efficient in the proportion of 1 per cent. for vaccine virus (no experiments made with a smaller amount), and in the proportion of $\frac{1}{2}$ per cent. for bacteria. Like nitrous acid, it broke down at $\frac{1}{4}$ per cent. in experiment No. 40, in which bacteria from putrid urine, dried upon filtering paper, were exposed to its action for six hours.

The conclusion reached is that these three agents, chlorine, nitrous acid, (nitrogen dioxide), and sulphurous acid (sulphur dioxide) are reliable disinfectants in the proportion of 1 volume to 100 of air. It is probable that a considerably smaller proportion of the above disinfectants would be efficient in destroying the potency of thin layers of virus in a moist state, or of virus exposed to the action of the disinfectant in an atmosphere saturated with moisture. It was my intention to determine the minimum quantity of each of these agents which could be relied upon to destroy the potency of vaccine virus, both in a dry and in a moist atmosphere, but the difficulty of obtaining unvaccinated persons upon whom to make the trial has prevented me from making further experiments in this direction up to the present time.

Carbolic acid.—The following remarks, quoted from Bulletin No. 47, show the results reached in my experiments with this agent:

> The amount of pure acid required to destroy the vitality of bacteria (10 grains, experiment No 42) is equal to about 17 pounds in a room twelve feet square and 12 feet high (capacity 1,728 cubic feet), and to fulfill the conditions of the experiment in disinfecting on a large scale, it would be necessary to scatter this amount over the floor of a room having these dimensions, and to suspend articles to be disinfected near the floor for at least six hours, care being taken that all apertures were closed so that the fumes of the acid might not escape. Experiment No. 43 shows that four times this amount (68 pounds) of "crude" acid placed upon the floor of a room of the same dimensions would not destroy the vitality of bacteria exposed in the room for six hours. Experiment No. 24 (Bulletin No. 29) shows that an amount of the impure acid equal to 46 fluid ounces volatilized in the same room will not destroy the potency of vaccine virus in a moist state (rubbed up with glycerine) when the time of exposure is twelve hours. Finally, these experiments show that the popular idea, shared, perhaps, by some physicians, that an odor of carbolic acid in the sick-room, or in a foul privy, is evidence that the place is disinfected, is entirely fallacious, and, in fact, that the use of this agent as a volatile disinfectant is impracticable, because of the expense of the pure acid and the enormous quantity required to produce the desired result.

RECENT EXPERIMENTS WITH NON-GASEOUS DISINFECTANTS.

Having ascertained that I have at hand a ready means of producing a fatal form of septicæmia in the rabbit (see special report to National Board of Health, Bulletin No. 44, vol. II), and that the blood and serum from the sub-cutaneous connective tissue of a rabbit recently dead possesses still greater virulence than the human saliva used in the first instance, the idea occurred to me that this virus could be used to good advantage in further experiments with disinfectants, the test being injection beneath the skin of a healthy rabbit. As the virus so introduced produces death in from twenty-four to forty-eight hours, it is evident that a negative result after treatment with a disinfectant is proof of its power to destroy the injected material or, in other words, to disinfect it.

My results have been, in the main, very definite and satisfactory, but my experiments have brought to light certain facts which I did not fully appreciate at the outset, and which to some extent detract from the value of the experiments herein reported.

These facts are:

(*a*) The action of certain substances may so modify the potency of the virus that the fatal event is postponed to the fifth to ninth day instead of occurring as usual during the first forty-eight hours after injection; consequently the assumption, upon which I at first acted, that a rabbit which seemed in good health four or five days after an injection, could be placed to the credit of the disinfectant and used for another experiment, cannot be considered a safe one, and it would have been better to allow a longer time to elapse or to have used a fresh rabbit for each experiment. This criticism only applies, however, to a small number of the experiments made, as I have rarely given more than two injections to the same animal, and in cases where a negative result followed the second as well as the first, the evidence is perfectly definite, the doubt only occurring in those cases in which a fatal result followed a second injection, which might possibly have been due to the previous injection, while credited to the last one made.

The following experiments will serve as examples of this postponement of the fatal event as the result of the action of the disinfectant used:

June 13.—Injected 0.5^{cc}. of virus, to which had been added one-tenth of 1 per cent. of iodine (in aqueous solution with potassium iodide).

Result.—Died June 24. Post-mortem examination made immediately after death (died in convulsions) showed hemorrhagic extravasations under the skin in vicinity of point of injection, spleen enlarged and dark colored, liver normal, blood from hemorrhagic extravasations under skin and from mesenteric veins (no other examinations made) contains an abundance of micrococci.

Same date (June 13).—Injected 0.5^{cc}. of virus containing 10 per cent. of oil of eucalyptus globulus.

Result.—Died June 21 (was killed when evidently on the point of death). Blood drawn into graduate measure coagulates very firmly. Serous discharge from bowels (abundant) contains an abundance of micrococci and other forms of bacteria; no bacterial organisms found in blood; no cellulitis; liver and spleen normal.

REMARKS IN THIS CASE.—There is no evidence of septicæmia, and it may be that the fatal result was due to the independent action of the oil of eucalyptus, or to some other cause independent of the injection made. Some of the serous discharge (0.25^{cc}.) from the bowels of this rabbit was injected into a small rabbit without result. An injection of 0.5^{cc}. of blood serum (from graduate measure after retraction of clot) into a small rabbit gave also a negative result.

In the first of these cases the post-mortem examination gave evidence of death from septicæmia. In the second the evidence was to the contrary effect; but it is very evident that either of these rabbits, if made the subject of a second experiment, on the fourth or fifth day after the first injection, although apparently in good health at the time, would have given an uncertain or fallacious result.

The following experiment made at the same time and with the same virus as the preceding is given to show that this virus was reliable:

June 13.—Injected 0.5^{cc}. of virus one part and camphor water (aqua camphora of the Pharmacopœia) one part into a small rabbit.

Result.—Death occurred during night of June 15 with the usual

symptoms of septicæmia—diffuse cellulitis, enlarged spleen, micrococci in blood, and effused serum in sub-cutaneous connective tissue.

(*b*) Several small rabbits have died without any injection, and from the appearance of the spleen and the presence of the micrococcus in the blood, I have concluded that these were cases of septicæmia, not of traumatic origin, resulting from confinement in cages in which other rabbits, the subjects of my experiments, have died. These septicæmic rabbits have very commonly a serous diarrhœa shortly before death by which their cages and the food remaining in them are soiled, and which contains an abundance of septic micrococci. I have proved experimentally that not only this serous discharge from the bowels but the saliva of an infected animal possesses virulent properties and produces speedy death with the usual symptoms. (See special report to National Board of Health, *l.* c.) I suppose, therefore, that these deaths resulted from exposure in infected cages, a supposition which is supported by the observations of Davaine, who affirms that septicæmia may occur among rabbits as an epizootic independently of any wound or contact with other rabbits suffering from septicæmia. (Recherches sur quelques-unes des conditiones qui favorisent ou qui empêchent le développement de la septicæmie. Bull de l'Acad. de Méd. 2 s., t. VIII, p. 121.)

That these rabbits died from an infectious septicæmia is further proved by the fact that a small quantity of one of them (0.25 cc.) injected beneath the skin of a large rabbit caused death with the usual symptoms in less than twenty-four hours.

As the companions of these rabbits of the same age (less than two months and weighing about a pound) were subjected to experiment and some died, doubt is thrown upon the result of these experiments and I am obliged to exclude them from my record.

(*c*) The most important source of error, however, and one which must be kept in view in future experiments, is the fact that a protective influence has been shown to result from the injection of virus the virulence of which has been modified without being entirely destroyed by the agent used as a disinfectant.

The following experiments will serve as examples of this:

May 24.—Injected into large rabbit (the subject of a previous experiment, May 13, in which a negative result was noted and in which 0.5 cc. of virus treated with 1 per cent. of sodium hyposulphite was injected) 1.25 cc. of virus, not disinfected from rabbit recently dead.

Result negative.

Same date (May 24).—Injected into large rabbit (subject of previous experiment, May 13, in which 0.15 cc of a mixture of virus three parts to alcohol, 95 per cent., one part was injected) 1.25 cc of virus not disinfected.

Result.—This animal died June 2, nine days after the injection. Post-mortem examination showed the spleen to be small and dark colored; liver contained numerous small abscesses; no diffuse cellulitis; no micrococci in blood. A small quantity of the blood of this animal (0.25 cc.) was injected into a small white rabbit (weighing about one pound). This animal died June 6. Post-mortem examination disclosed limited cellulitis without the presence of micrococci; liver and spleen normal; no micrococci in blood, which contains numerous granular white corpuscles.

REMARKS.—These two animals probably died as the result of the injections made, but they evidently did not die from the malignant infectious septicæmia produced by introduction beneath the skin of an unprotected animal of a small quantity of fluid containing the micrococcus. In the latter case we not only have the marked difference as to date of death, but the characteristic diffuse cellulitis, the greatly enlarged spleen, and the presence of the micrococcus, as distinguishing characteristics. It may be that death in these cases resulted from the poisonous properties of the sepsin, a chemical poison contained in the blood injected, but it is evident that both of the large rabbits previously experimented upon possessed an immunity from the action of the septic micrococcus, or rather that it could not multiply in the bodies of these protected animals, and consequently that death did not result from the infectious form of septicæmia, which has recently been the subject of my studies (*l.* c.). This immunity corresponds with what has been proved to be the case in *charbon*, chicken-cholera, and pleuro-pneumonia of cattle, in which diseases it has been shown that protective inoculations may be practiced.

In the first case above reported the result was completely negative.*

Although the amount of virus injected was considerable (1.25 cc.) and this virus was proved by comparative experiments to be potent, other evidence might be adduced in favor of the view that protection results from the effects of inoculations made with virus modified by the action of certain agents; but my object here has simply been to show the importance of considering this possible protective influence of previous injections in making disinfection experiments upon a virus of this character.

My method of collecting virus for disinfection experiments has been to wipe up the bloody serum from the subcutaneous connection tissue and from the thoracic and abdominal cavities, after removal of the viscera and puncture of the large veins, with dry cotton, which is then washed out in water. The potency of this diluted virus has been amply proven and, indeed, in every series of experiments made at the same time and with the same material I have obtained evidence of virulence either from injection of non-disinfected virus as a check experiment, or by the failure of one or more of the substances undergoing trial as disinfectants. Thus in the experiments just reported, the same virus killed a rabbit in less than three days after having been treated with a 4 per cent. solution of magnesia sulphas.

I have not attempted to determine the minimum quantity of virus that would be effectual, but have kept on the safe side by injecting quantities much in excess of the amount required to produce fatal septicæmia. In the experiments of Davaine (*l.* c.), in which the virus in the first instance was obtained from a different source, fatal septicæmai was produced by injections of septicæmic blood in quantities as small as $\frac{1}{750}$ part of a drop.

When we are dealing with a virus of which the virulence depends upon the presence of a living organism capable of self-multiplication in the body of the animal into which it is introduced, it is evident that the question of quantity is quite secondary to that of vital activity on the part of the pathogenic organism and vital resistance upon the part of the living tissues of the animal subjected to its action.

It seems probable, in the light of recent experiments, that pathogenic properties in these lowly organisms depend upon rapidity of development and adaptability to conditions such as are found in the interior of the bodies of living animals, and that these qualities may be developed in common and usually harmless bacterial organisms as the result of specially favorable conditions such as high temperature, abundance of pabulum, &c.

That the virus which has been used in these experiments is capable of producing death in much smaller quantities than those used, is shown by the following experiment:

June 2.—The needle of a hypodermic syringe was dipped into the blood of a septicæmic rabbit just dead, and proved by microscopical examination to contain an abundance of the micrococcus. It was then introduced under the skin of a small rabbit.

Result.—This animal died within 48 hours and presented all the usual appearances of death from septicæmia.

An additional possible source of error will suggest itself as arising from the extreme virulence and the small quantity of material required to produce death. A very little of this material, not disinfected, adhering to the needle of the hypodermic syringe from our experiment might be the cause of death in a succeeding one and might improperly be ascribed to failure of the disinfectant used in the last experiment. This possibility I have had in view and have carefully guarded against by a thorough disinfecting and cleansing of my syringe after each injection. This has been effected by means of a 10 per cent. solution of carbolic acid or more frequently with diluted sulphuric acid, followed by repeated washings with pure water.

My practice has been to mix the different disinfectants to be used at one time with separate portions of virus, obtained as already described from the cellular tissue and blood-vessels of a rabbit recently dead, in small beakers well cleaned, and to allow a period of 20 minutes to half an hour for the action of the disinfecting agent before making an injection.

Standard solutions of the different substances to be tested were kept in glass-stoppered bottles, and at the outset of my experiments these solutions were made of the strength of 5 per cent. Solutions of 4 per cent. were afterward substituted for these because of the greater convenience in reducing the quantity without fractions. Thus one part of virus and one part of a standard 4 per cent. solution gave me the proportion of 2 per cent.; three parts of virus and one of the disinfectant gave the proportion of 1 per cent., &c.

Having fairly stated the possible sources of error in experiments made by this method, I may be permitted to say that I believe my results to be in the main reliable, and that the substances which have best stood the test may be depended upon in practical disinfection in the proportions found to be efficient.

In but a single instance have I had a contradictory result in which the greater quantity failed and the smaller did not. This was in the use of zinc chloride, with which three experiments were made. The rabbit injected with 1 per cent. died, while two others injected with 2.5 per cent. and 0.5 per cent gave a negative result. To which of the possible causes of error, already pointed out, this contradictory result is due I am unable to say. The rabbit injected with 1 per cent. may have died from some cause independent of the injection, or from the remote effects of a previous injection, or the rabbit injected with 0.5 per cent may have been protected by a previous injection. It is evident that in future experiments by this method it will be desirable to use a previously uninjected animal for each experiment.

After this somewhat lengthy preamble, which has seemed necessary, I shall proceed to detail the results of these experiments, placing first those substances which have proved most efficient. For convenience each experiment will be recorded by placing after the name of the substance used the figures representing the proportion in which it was used. Death, or failure to disinfect, is indicated by a full-faced figure representing proportion of disinfectant used. The plain figure indicates a negative result or destruction of virulence by disinfectant disinfection.

* In these experiments no temperature observations have been made, and by a *negative* result failure to kill only is implied. No doubt slight indisposition and a greater or less amount of fever might have been verified in many cases by careful observations, but the object in view rendered such observations unnecessary and want of time rendered them impracticable.

GROUP 1.

Disinfectants efficient in the proportion of 0.5 per cent.

Iodine (in aqueous solution with potassium iodide) 1.25, 0.5, 0.25, 0.2, **0.1**.*
Chromic acid, 1, 0.5, 0.2, 0.1. (No failure.)
Ferric sulphate, 1.25, 0.5, 0.25, 0.12, **0.12**.†
Cupric sulphate, 1, 0.5, 0.25, **0.1**.
Thymol dissolved in alcohol, 1, 0.25, **0.1**.
Caustic soda, 2.5, 1, 0.5, 0.25, **0.2**.
Nitric acid, 1.25, 0.5, 0.25, **0.2**.
Sulphuric acid, 1.25, 0.5, **0.25**.
Ferric sesquichloride, 1, 0.5, **0.25**.
Sodium hyposulphite, 1, 0.5, **0.25**.
Hydrochloric acid, 0.5, **0.25**.

GROUP 2.

Disinfectants which failed at 0.5 per cent., but proved efficient in proportions below 2 per cent.

Carbolic acid, 2.5, 1.25, **0.5**.
Salicylic acid (as salicylate of soda), 2.5, 1.25, **0.5**.
Zinc chloride, 2.5, **1**, 0.5.‡
Caustic potash, 2.5, 1, **0.5**.
Iron-alum, 2, 1.
Zinc sulphate, 1.25, **0.5**.
Potassium sulphide (sulphuret), 2, **0.5**.
Tannic acid, 1, **0.5**.
Boracic acid, 2, **1**, **1**.
Potassium permanganate, 2, **1**, **1**.
Sodium biborate, 2.5, **1.25**.

GROUP 3.

Substances which failed to disinfect in the proportion of 2 per cent.

2.5.
Potassium nitrate, **1**.
Potassium chlorate, **1**.
Sodium chloride, **2.5**.
Alum, **1.25**, **1**.
Lead acetate, **2**.
Magnesia sulphate, **1**.
Glycerine, 25, 12.5, **10**.
Alcohol (95 per cent.), 25, **12.5**, **10**.
Camphor water. Equal parts of camphor water and virus were injected with a fatal result.
Pyrogallic acid, **1**.
Oil eucalyptus globulus, **10**.§

REMARKS.—It was my intention to make this experimental inquiry as complete as possible before reporting, and to fix definitely the minimum quantity which may be relied upon to destroy the potency of septic virus (*micrococcus septicus*) of those substances most commonly used as disinfectants, or prescribed internally, or as lotions, with a view to their antiseptic action; also to determine the time during which the septic virus will retain its potency in a dry state; the effect of gaseous and volatile disinfectants upon the dried virus, both in a dry and moist atmosphere; the comparative value of various proprietary disinfectants now in the market; the thermal death-point of *micrococcus septicus*, &c.

It will be seen that I have fallen far short of the accomplishment of this purpose, but I have thought it best to report what has already been accomplished, as practical sanitarians may obtain some hints of value from the experiments recorded, and it is very uncertain when I will be able to resume my experiments, which I have been obliged to discontinue on account of the pressure of other duties and the difficulty of obtaining rabbits for experimental purposes.

* In the experiment with 0.1 per cent. the animal did not die until eleven days after the injection; it is, therefore, hardly fair to consider this a failure of the disinfectant, but in the absence of additional experiments I have thought it best to mark this as a failure, and to assume that the limit of safety as to proportion of disinfectant required has been passed. It was my intention to make a separate series of experiments with potassium iodide for the purpose of ascertaining whether this agent should receive a portion of the credit for the results obtained by the solution used. The scarcity of rabbits has prevented me from making this experiment up to the present time.

† Two experiments were made with 0.12 per cent. of ferric sulphate, in one of which the result was negative (disinfection), and in the other the rabbit died (failure to disinfect).

‡ See remarks on p. — for explanation of this contradictory result.

§ The rabbit injected with one part of oil eucalyptus to nine of virus did not die until eight days after the injection, and the post-mortem examination showed that it did not die of septicæmia. This cannot, therefore, be fairly considered a failure to disinfect, and further experiments will be required to determine the value of this agent, which is especially interesting just now from the fact that Lister is using it in his antiseptic dressings to wounds.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

ABSTRACTS FROM CONSULAR REPORTS.

CARTHAGENA, UNITED STATES OF COLOMBIA.—United States Consul E. W. P. Smith reports, under date of June 4, that the health of the consular district embracing Carthagena is generally good. Three cases of small-pox occurred during the week next preceding the date of the report, but no deaths from the disease have been reported. In September, 1880, over forty deaths from yellow fever occurred among soldiers temporarily quartered in the city while en route for Panama. The disease was, however, confined to the military, and it may be said that yellow fever seldom becomes epidemic among the resident population. No epidemic has occurred in this consular district during my residence of two years.

CONSTANTINOPLE.—Later advices received from United States Consul G. H. Heap confirm the reports heretofore published concerning the rapid disappearance of the plague in Bagdad and vicinity. The organization of the sanitary inspection corps has been remarkably thorough, and the system of isolation of sick and the removal of the well into camps has been rigidly enforced. This, together with the strict attention given to the matter of disinfection, has resulted in rapidly stamping out the disease.

HOBART TOWN, TASMANIA.—United States Consul A. G. Webster reports that during the month of April there were 40 deaths from ordinary causes.

MARACAIBO, VENEZUELA.—Reports received from United States Consul E. H. Plumacher for the two weeks ending June 25, indicate the continued presence of yellow fever at Maracaibo, though not in epidemic form, and that the city is still in bad sanitary condition.

MELBOURNE AND SUBURBS.—United States Consul O. M. Spencer reports, that during the month of April there were 482 deaths, of which 15 were from typhoid fever and 10 from other contagious or infectious diseases.

MONTREAL, CANADA.—Acting United States Consul-General M. Anthony reports 260 deaths in Montreal from June 4 to 25 inclusive. Population 140,000. Annual death rate per 1,000, 32.19. Among the deaths reported there were 18 from diphtheria, 5 from whooping-cough, 1 from measles, and 1 from scarlatina.

PUERTA PLATA.—Theodore Huysman, United States commercial agent, reports, under date of June 28, that small-pox still continues in Puerta Plata and surrounding district.

ROSARIO, ARGENTINE REPUBLIC.—Acting Vice-Consul M. Amelong, forwards, under date of June 2, the returns of the board of health of Rosario from January 1, 1880, to March 31, 1881. The population is estimated at about 25,000, and the number of deaths reported during the above-named period is 1,010. No epidemics are reported as having occurred during the period covered by the returns.

YOKOHAMA, JAPAN.—United States Consul-General Thomas P. Van Buren states, under date of June 24, that the health report of Yokohama for the month of May shows a total of 148 deaths. Among the natives there were 13 cases of typhoid fever and 3 deaths, and 45 cases of typhus fever and 4 deaths. Among the foreigners there was but one case of typhus fever, and in this the patient recovered. There were, however, three deaths among foreigners, cause not reported.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

CAMDEN, N. J.—Information received from Dr. W. H. Wroth, city physician, states that Dr. Marcy reports one fatal case of Asiatic cholera in Camden on July 5.

CHICAGO, ILL.—The report of the registrar of vital statistics for the month of June shows a total of 963 deaths; annual rate per 1,000, 22.96. Of the total number of deaths 550 were under five years of age, and of this number 352 were under one year.

The deaths from phthisis pulmonalis were 71; acute lung diseases, 80; diarrhœal diseases, 121; typhoid fever, 24; cerebro spinal fever, 47; diphtheria, 45; croup, 21; measles, 12; scarlatina, 15, and small-pox, 35. As compared with the month of May, 1881, the report shows a great reduction in the mortality, the total number of deaths during that month being 1,287, or 324 in excess of the number reported in June. The meteorological summary shows the highest barometer, 30.158; lowest, 29.594; range, 0.554. Thermometer, highest, 89°; lowest, 46.2°; range, 28.9°. The mean temperature during the month was 63.2, being a little below the average for the corresponding period during the past nine years. The amount of rain-fall during the month was 5.93 inches, which is largely in excess of the average precipitation during this portion of the year.

CINCINNATI, OHIO.—Dr. Thomas C. Minor reports, under date of July 16, that the temperature at Cincinnati for the week ending the

14th, had reached as high as 103° in the shade and 127° in the sun. The excessive heat has been almost continuous during the past ten days. The heat absorbed by the pavements and house walls during the day has been slowly radiated during the night, so that almost as many people have been overcome by heat at midnight as at midday. Five hundred and forty-nine deaths were reported at the health office from noon July 7, to noon July 14, a daily average death rate greater than at any time since the epidemic of cholera in 1849, and again in 1866.

Many of the deaths were not due to heat but in a vast majority of cases it constituted the predisposing cause. The following table exhibits the daily mortality from insolation and from radiated heat during the week ending July 14:

Date.	Deaths from sunstroke.	Deaths from heat.	Total for day.	Maximum temperature.	Mean daily temperature.
				°	°
July 7	4	16	20	98	88
July 8	10	11	21	99.5	89.4
July 9	22	19	41	100.5	89.9
July 10	31	21	52	103.5	91.1
July 11	37	31	68	102.5	91.7
July 12	39	13	52	102.2	91.4
July 13	43	24	67	99.2	89.3

	213	150	363		

The warm weather still continues notwithstanding the storm and rain-fall on the 14th, and cases of sunstroke are still being reported.

At the Cincinnati hospital where many of the worst type of cases were sent, the mortality was 1 in 7. The total number of cases of prostration from heat occurring in the city to the present date may be roughly estimated at 2,000.

In more than one hundred cases the temperature, pulse rate, respiration, &c., have been carefully noted. In the case of the highest temperature, 110° Fah., the patient died, though a number of patients having a temperature of 108° recovered. The lowest temperature recorded in a case of collapse, and after recovery, was 95.5°.

One patient had a pulse rate of 286 and a temperature of 106.2, and recovered, but is now said to be insane.

Hypodermic injections of atropine and diptaline were used in some cases, but the results of such experiments have not yet been published.

HAVANA, CUBA.—Advices received from Havana to July 9, state that during the week ending on the 8th instant, there were 23 deaths from yellow fever, and 15 deaths from small-pox. Of the decedents from yellow fever, 8 were civilians and the remaining 15 were in the army and navy. There are now not less than 85 cases of yellow fever in the city. Some of the merchant vessels at wharves are suffering from the disease, but none of the vessels which have been only in the open bay appear to have been attacked. All of the naval vessels which are undergoing repairs adjacent to the Military Hospital have been invaded.

The town of Sagua la Grande is suffering severely from yellow fever, but the shipping, twelve or fourteen miles distant, is reported entirely free from the disease.

HUDSON COUNTY, N. J.—C. J. Rooney, clerk of the board of health and vital statistics, of Hudson County, N. J., reports a total of 329 deaths in Hudson County, during the month of June; population 375,899; annual death rate per 1,000, 20.7.

The annual death rate in the county for the corresponding period during the past five years is given as follows: 1881, 20.7; 1880, 26.3; 1879, 18.7; 1878, 20.5; 1877, 19. Deaths under five years for the corresponding period, 1881, 9.4; 1880, 15.5; 1879, 7.7; 1878, 11.5; 1877, 10.4.

The slight decrease in the mortality in the county at large, contrasted with the average for the past five years, is ascribed to the reduction in number of deaths of children under five years of age, caused by a falling off in the number of deaths from zymotic diseases.

LAKE, ILL.—Dr. A. L. Corey reports, under date of July 13, an unusual mortality from diseases of the nervous system during the quarter ending June 30. The deaths reported during the quarter are as follows: Congestion of the brain, 5; inflammation of the brain, 6; cerebro-spinal meningitis, 6; convulsions, 9; hydrocephalus, 1. Total, 43.

NOTICE.—Extra copies of the BULLETIN will be furnished at this office at the rate of *five cents* per copy Notice of at least one week should be given when a large number is required.

NEW YORK, N. Y.—Dr. John T. Nagle furnishes the following mortality report for the quarter ending March 31, 1881:

Total number of deaths in New York City during the first quarter of 1881, 9,120. Population estimated in the middle of the year, 1,242,533. Annual death rate per 1,000, 29.36. The deaths are classified as follows: Zymotic diseases, 2,352; constitutional diseases, 1,980; local diseases, 3,931; developmental diseases, 609; deaths from violence, 248.

The number of deaths from five contagious diseases during the quarter was 1,281, as follows: From small-pox, 95; measles, 77; scarlatina, 504; diphtheria, 552; whooping-cough, 53.

The number of cases of these diseases reported to the sanitary superintendent during the quarter was as follows: Cases of small-pox, 283; measles, 631; scarlet fever, 2,015; diphtheria, 1,364. There were also 46 cases of typhus fever and 124 cases of typhoid fever reported during the quarter, with 6 deaths from typhus and 54 from typhoid fever during that period. The deaths from typhus fever occurred mainly among the very poor.

The deaths from the chief pulmonary diseases and of children in the first year and in the first five years of life and the deaths in public institutions were as follows: Bronchitis, 488; pneumonia, 1,128, phthisis pulmonalis, 1,386. Deaths of children under one year, 1,812. Deaths of children under five years 3,711. Deaths in institutions, 1,672.

It will be seen from the following table that there was an increase in the number of deaths from small-pox, scarlatina, diphtheria, croup, typhus and typhoid fever, and a decrease in the number of deaths from measles and whooping-cough, when compared with the number of deaths from these diseases during the first quarter of 1880. The increase in the number of deaths from these diseases is noted as follows: From small-pox, 95; scarlatina, 412; diphtheria, 338; croup, 106; typhus fever, 6; and typhoid fever, 10; while the decrease in the number of deaths from measles was 184, and from whooping-cough 29.

Comparative table of mortality from the principal causes of death in the first quarter of the year 1881, with the corresponding quarter of the preceding five years.

Causes of death.	1881.	1876.	1877.	1878.	1879.	1880.	Total for 5 years preceding 1881.	Average for 5 years preceding 1881.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, JULY 30, 1881. [No. 5.

ORIGIN AND GROWTH OF THE QUARANTINE SYSTEM OF THE UNITED STATES.

[By STEPHEN SMITH, A. M., M. D., of New York.]

FLORIDA.

The following summary of the laws relating to quarantine in the State of Florida was prepared by DR. R. R. S. HARGIS, of Pensacola, Fla.

The first general law regulating quarantine in Florida passed the Senate December 23, 1852, and the House December 29, 1852. It was approved by the governor January 8, 1853. It was as follows:

AN ACT to regulate quarantine laws in this State.

SECTION 1. *Be it enacted by the senate and house of representatives of the State of Florida in general assembly convened*, That the mayor and aldermen of every city or town in this State upon or adjacent to any bay, river, or harbor where there is a port of entry, or in the absence of any incorporated city or town, the justice of the peace of every justice's district adjacent to such ports of entry, and including the location of any unincorporated town or depot or place of landing, shall be, and are hereby, constituted a board of health in said incorporated city or town, or in such justice's district.

SEC. 2. *Be it further enacted*, That the mayor of such incorporated city or town, or, during his absence or other disqualification, such persons as the board of health may elect, shall be president of such board of health in such incorporated city or town, and that such persons shall be president of the board of health in any such justice's district as may be elected by such justices of the peace for such districts respectively.

SEC. 3. *Be it further enacted*, That said board of health be, and are hereby, empowered and required to appoint a port inspector, who shall be a regularly licensed physician, whose duty it shall be to board all vessels coming into the ports of which he may be appointed such inspector, and report to the board of health if any contagious, malignant, pestilential, or infectious diseases are prevailing on board said vessels, to order the same into quarantine at such place or places as may be designated by the board of health.

SEC. 4. *Be it further enacted*, That said board of health be, and are hereby, fully empowered to fix the rate of compensation or fees to be paid to said port inspector for all services performed by him as such, which shall be paid by the master or owner of any vessel so visited by him as aforesaid, and on failure of any master or owner of any vessel to pay the fees as fixed by said board of health, the said port inspector may proceed to collect the same by action of debt before any justice of the peace of the county in which such port may be situated.

SEC. 5. *Be it further enacted*, That any master or owner or purser of any vessel who shall refuse to obey the order of any port physician directing such vessel to remain in quarantine under the by-laws, rules, and regulations of such board of health shall be liable to indictment, and, on conviction, shall be fined in a sum not exceeding $1,000, or imprisoned not exceeding six months, at the discretion of the jury.

SEC. 6. *Be it further enacted*, That the jurisdiction of the board of health for the city of Key West shall extend to and include the whole island upon which said city is situated.

SEC. 7. *Be it further enacted*, That all acts or parts of acts conflicting with the provisions of this act be, and the same are hereby, repealed.

In 1855, January 10 and 11, the legislature passed a special act, chapter 705 (No. 96), regulating quarantine for the port of Saint Mark's, constituting the president and board of council of the town of Newport, in Wakulla County, and their successors in office, the board of health, giving said board jurisdiction in case of quarantine over all the waters from the bar of Saint Mark's River up said river, including all rivers, inlets, or creeks entering or running therein, &c. It provided as follows:

AN ACT to be entitled "An act regulating the quarantine for the port of Saint Mark's."

Whereas it is highly expedient that the corporation of the town of Newport, Wakulla County, should exercise the power of compelling vessels coming from ports or places suspected to be infected with contagions or malignant diseases to perform quarantine; and whereas doubts have arisen whether the corporation is invested with such power under the existing laws; for the removal of such doubts—

SECTION 1. *Be it enacted by the senate and house of representatives of the State of Florida in general assembly convened*, That from and after the passage of this act it shall be lawful for the president and board of council of the town of Newport, in Wakulla County, and their successors in office, who shall be, and they are hereby, declared the board of health for the town of Newport and port of Saint Mark's, to do all things and enforce all acts as (are) now authorized by the general quarantine laws of the State, so far as relates to the port of Saint Mark's and town of Newport, and that whenever they shall have reason to suspect that any vessel or vessels, person or persons, has or have sailed from or come from any port or place infected, or supposed to be infected, with any malignant or contagious diseases, (they may) by resolution or order, compel said vessel or vessels to come at anchor or stop at the Spanish Hole, or such other place by the order or resolution pointed out, until an examination is made by the health officer as to the state and condition of the said vessel or vessels, person or persons, and until sufficient purification shall have taken place, and a certificate of the health officer obtained to that effect.

SEC. 2. *Be it further enacted*, That the aforesaid board of health shall have jurisdiction, in case of quarantine, over all the waters from the bar of Saint Mark's River up said river, including all rivers, inlets, or creeks entering or running therein, and shall have the power to compel each and every pilot of the port of Saint Mark's to obey their instructions, order, or resolution in reference to the quarantine of any vessel, and (for) any violation or infraction of said instructions he or they shall be fined in a sum of fifty dollars, to be collected in the same manner as fines in other cases are directed to be collected by the general laws.

In January, 1859, the legislature passed an act constituting the intendant and councilmen of Jacksonville, in Duval County, a board of health, with power to execute the general quarantine law over all the waters of the Saint John's River, including all rivers, inlets, or creeks entering or running therein, with power to impose, for violation of quarantine rules, a fine not exceeding $100. It was as follows:

AN ACT in relation to quarantine at the town of Jacksonville.

SECTION 1. *Be it enacted by the senate and house of representatives of the State of Florida in general assembly convened*, That from and after the passage of this act it shall be lawful for the intendant and councilmen of the town of Jacksonville, in the county of Duval and State of Florida, and their successors in office, who shall be, and they are hereby declared, the board of health for the said town of Jacksonville, to do all things and enforce all acts as are now authorized by the general quarantine laws of the State, so far as relates to the said town of Jacksonville, and that whenever they shall have reason to suspect that any vessel or vessels, steamboat or steamboats, person or persons, has or have sailed from or come from any port or place infected with any malignant or contagious disease, they may, by resolution or order, compel said vessel or vessels, steamboat or steamboats, to come to anchor or stop and remain at Danie's Point, on the river Saint John's, or such other place by order or resolution of said board of health pointed out, until an examination is made by the health officers of said town of Jacksonville as to the state and condition of said vessel or vessels, steamboat or steamboats, and the persons on board the same, and until sufficient purification shall have taken place and the requisite quarantine performed under the order and resolution of the said board of health, and a certificate of said health officers obtained to that effect.

SEC. 2. *Be it further enacted*, That the aforesaid board of health shall have jurisdiction, in cases of quarantine, over all the waters from the bar of Saint John's River up said river, including all rivers, inlets, or creeks entering or running therein, and extending to the southwestern limits of said town of Jacksonville, as defined by the charter of said corporation and the amendments thereto, and shall have the power to compel each and every master of each and every vessel or steamboat, or pilot or other person having the charge or command of such vessel or steamboat, and the commander or person in charge of any towboat bringing such vessel or steamboat within the limit aforesaid, to obey the instructions, orders, and resolutions of said board of health in reference to the quarantine of any vessel

or steamboats, person or persons, and for each and every violation or infraction of said instructions, orders, and resolutions, he or they shall be fined in a sum not exceeding one hundred dollars, to be collected by warrant from the intendant of said town.

SEC. 3. *Be it further enacted*, That nothing in this or any other act contained shall be so construed as to prevent steamers or other water crafts bound to a point or points beyond the corporate limits of Jacksonville from passing up and down the Saint John's River to the point of destination: *Provided*, That in so doing they shall not come to within the waters of said corporation, nor land any person or persons, goods or merchandise, United States mail excepted, within ten miles either above or below said city; *And provided further*, That said steamer or other water crafts in passing through the water of said corporation shall be, and they are hereby, required to be confined to the most southerly channel of sufficient depth of the waters of said corporation.

SEC. 4. *Be it further enacted*, That all acts and parts of acts inconsistent with and contrary to the provisions of this act be, and the same are hereby, repealed.

The legislature, December 7, 1866, repealed the above act and revived and declared act of 1852–'53 (general acts) to be in full force there:

AN ACT to repeal an act approved January 13, 1859, entitled "An act in relation to quarantine for the city of Jacksonville."

SECTION 1. *Be it enacted by the senate and house of representatives of the State of Florida in general assembly convened*, That the act entitled "An act in relation to the quarantine of the city of Jacksonville," approved January 13, 1859, be, and the same is hereby, repealed, and that the act entitled "An act to regulate quarantine laws in this State" is hereby declared to be revived in full force and virtue over and for the said city.

The following act was passed in 1870:

AN ACT to enforce the penalties for the violation of quarantine laws.

The people of the State of Florida, represented in senate and assembly, do enact as follows:

SECTION 1. That any vessel violating the quarantine regulations in force at any time at any place in this State shall be liable to be attached for the penalty of such violation.

SEC. 2. *Be it further enacted*, That it shall be the duty of the clerk of the circuit court of the county in which such violation occurs to issue a writ of attachment against such vessel, her tackle, apparel, and furniture, upon the filing under oath by the mayor of incorporated cities, or the health officer of any port where there is no such corporation, a statement of such violation.

SEC. 3. *Be it further enacted*, That further proceedings under such attachment shall be the same as in other cases of attachment.

Approved June 6, 1870.

OUTLINE OF A PLAN FOR RAILROAD SANITARY SERVICE.

The following plan of sanitary supervision of railroads has been formulated by Dr. S. S. Herrick, of New Orleans, secretary of the Louisiana State board of health. The objects sought to be attained are highly important:

(1.) Organization and superintendence of a system for prompt relief to sufferers from the casualties of travel upon the lines, having reference to officials, employés, and passengers. Assistance in the adjustment of claims for personal damage in such casualties.

(2.) Examination of those engaged in the movement of trains, with reference to defects of sight and hearing and diseases of the heart and great vessels, as a prerequisite to their employment. Advice concerning the personal hygiene of employés in all branches of service.

(3.) Inspection of the sanitary condition of passenger-coaches, of grounds and buildings, and recommendation of improvements wherever needed. As occasion presents, counsel in the selection of sites and in the construction of works and buildings.

(4.) Organization and superintendence of a system of meteorological observations at selected stations along the lines.

(5.) To guard against danger of infecting railroad-coaches, stock and goods cars, by transportation of diseased persons or animals, or of infected personal baggage or merchandise; against danger of conveying contagion from one point to others; and against injury to stock *in transitu* from overcrowding, long confinement, and deprivation of food and water.

(6.) To confer with national, State, and local sanitary authorities, with the view of obviating or moderating restrictions on travel and traffic; and to represent the company in sanitary and quarantine consultations, wherever its interests may be affected.

The above sketch, for a company operating extensive lines, contemplates a sanitary department, under the superintendence of a chief medical officer, with the necessary number of subordinates at suitable intervals, in readiness for any emergency. The subordinate medical men would be required only in case of accidents, or occasionally to make physical examinations of trainmen. Meteorological observations could be made by telegraph operators along the lines.

Some of the features of this scheme are not altogether new. The first, particularly, has been partially adopted by some of the most important companies, but without putting the whole service under a uniform system and the superintendence of a medical man. The second may have some vague recognition by railroad managers, but has not acquired system, precision, and effectiveness. Yet it is apparent that near-sighted, color-blind, and deaf men should not be trusted with the movement of trains or engines; nor men liable to sudden death from organic faults of the heart or large blood-vessels.

It is not supposed that 3 and 4 would be immediately appreciated, but eventually they might be adopted. It is apparent, however, that the latter might be made supplementary to the National Signal Service, whereby its operations would be greatly enlarged to the benefit of inhabitants along the lines and to the railroad companies, by giving timely warning of the approach of storms.

The fifth and sixth are undeniably important, especially for lines running between New Orleans and Texas, from apprehension of yellow fever on the one hand, and of diseased cattle on the other. In this way the general management of a railroad company would be brought into harmony with sanitary authorities, communities would feel safe from danger of infectious diseases, and panics and unreasonable interruptions of business would be prevented.

While sanitarians must appreciate the advantages of such a service to the public, the actual question at issue for a railroad company would be decided on pecuniary grounds. In most respects the scheme is essentially a kind of insurance against risks of serious loss; and more truly so than insurance against fire and marine risks, for the service aims at *prevention*, instead of *reimbursement*. It is apparent that the dangers constantly impend, and that the plan fairly promises their preclusion. Then the real question is, whether the risk justifies the premium, or whether the service would save its cost. It might save much more in preventing disasters, in averting a short or partial interruption of business, in obviating troublesome prosecutions for damages. More than this, it would create confidence in the management, a sense of security among the traveling public, the value of which could not be calculated with precision, but might become appreciable by comparison of rival routes adopting different policies.

Dr. R. J. Farquharson, secretary of the State board of health of Iowa, furnishes the regulations adopted by that board regulating the transportation of corpses by railroads and steamboats in the State of Iowa, as follows:

TRANSPORTATION OF CORPSES.

Rules for the transportation of corpses by railroads and steamboats in the State of Iowa.

IOWA STATE BOARD OF HEALTH,
OFFICE OF THE SECRETARY,
Des Moines, Iowa, May 20, 1881.

RULE 1. The transportation of the bodies of persons dead of smallpox, Asiatic cholera, or yellow fever, is absolutely forbidden.

RULE 2. From November 15 to March 15, all dead bodies may be transported without restriction, except that those dead of diphtheria, scarlet fever, typhus or typhoid fever, in addition to being in a metallic or wooden coffin, and this inclosed by a tight wooden box, must be closely wrapped in a carbolated cerecloth, or some equally effective substitute.

RULE 3. From March 15 to November 15, all bodies presented for transportation must be prepared as described in the latter part of Rule 2.

RULE 4. Every dead body must be accompanied by a physician's certificate of death, a permit for transportation from the clerk of the local board of health, and a written certificate from the shipping undertaker that the corpse has been prepared for transportation in accordance with the rules of the Iowa State board of health.

Instruction for undertakers.

RULE 5. A carbolated cerecloth is a strong cotton winding-sheet which has been dipped in a melted mixture of wax, tallow, or lard, and carbolic acid; a cheaper substitute is one dipped in a strong watery solution of carbolic acid, or of chloride of zinc (Burnett's solution).

W. S. ROBERTSON, M. D.,
President.
R. J. FARQUHARSON, M. D.,
Secretary.

NOTE.—"Rules and regulations made by the State board of health and directed to local boards of cities, towns, &c., are of full force and effect upon the people without subsequent indorsement or action of such local boards."—*Decision of the Attorney-General, January 4, 1881.*

MORTALITY IN FOREIGN CITIES, COMPILED FROM WEEKLY CONSULAR REPORTS TO NATIONAL BOARD OF HEALTH.

Countries.	Places.	Population.	Week ending—	Total deaths.	Annual rate per 1,000.	Cholera.		Yellow fever.		Small-pox.		Typhoid fever.		Typhus fever.		Other contagious diseases.		Weekly mean thermometer.
						Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.	Cases.	Deaths.

ABSTRACTS FROM CONSULAR REPORTS.

ASPINWALL.—United States Consul James Thorington reports ten deaths during the two weeks ending July 16, population 3,000, and that the town is free from contagious and infectious diseases.

CONSTANTINOPLE.—United States Consul G. H. Heap forwards advices regarding the plague in Mesopotamia to June 23. From these it appears that the plague is now limited to Chamic alone, and that only sporadic cases are occurring. During the week ending June 3, there were but twenty-three deaths in the entire plague district and eleven new cases.

The cordon and quarantine at Mussèyeb, Mohavil, and Samawa are still maintained with great strictness, as also local cordons around the villages of Hille, Kerbella, and Divanie.

In this district ninety-three houses (huts), with the baggage of the sick and dead, have been burned during the past month.

The town of Nedjeff has, by order of the sanitary bureau, been evacuated entirely. All the houses have been whitened with lime and fumigated with sulphur, and the cisterns have all been cleansed and disinfected. Under these energetic measures the plague entirely disappeared from Nedjeff, no cases having occurred between June 9 and 23. The cordon around the village is, however, still maintained to prevent new importations.

At Mouschehab over three thousand deaths occurred from the plague during the months of February, March, April, and May. As stated in dispatches heretofore published, the dwellings and effects of persons who have been afflicted with the plague have been burned. This work of destruction has been accomplished with the greatest difficulty and in the face of the most determined opposition on the part of many of the inhabitants.

In spite of the efforts of the sanitary bureau, more than three hundred dwellings in which cases of plague had occurred remained standing on the 16th of June. During the past week these have all been destroyed and the disease has disappeared. The Sheik Faraon has rendered great assistance in the sanitary work, at the imminent peril of his life, and was severely injured in an engagement with the Arabs who were determined to prevent the burning of the dwellings as above stated.

In addition to the dwellings destroyed at Mouschehab about one hundred have been destroyed in other places where the plague occurred during the spring, and the cordons and quarantines are still continued at Mussèyeb, Mohavil, Lamava, Hille, Kerbella, and Divanie.

MONTEVIDEO, URUGUAY.—United States Consul A. L. Russell reports 271 deaths in the city of Montevideo during the month of May. The official population of the city is stated at 111,500, which shows an annual death-rate of 30.07 per 1,000. Among the deaths reported are, consumption, 54; small-pox, 9; and typhoid fever, 6.

RIO DE JANEIRO.—Consul-General Thomas Adamson reports the total number of deaths from all causes during the week ending July 2 as 173. Estimated population 330,000; annual death-rate per 1,000, 27.33. Pulmonary affections are reported as prevailing, and there were 29 deaths from consumption. There were also 2 deaths from yellow fever; 2 from pernicious fever; 1 from small-pox, and 1 from typhoid fever.

VALPARAISO, CHILI.—United States Consul L. H. Foote reports that the total number of deaths in Valparaiso during the month of May was 395; population, 101,088; annual death-rate per 1,000, 46.89. Among the deaths reported during the month there were from phthisis, 48; lung diseases, 60; fevers, 129; and small-pox, 3. The sanitary condition of the town is good, and no contagious or infectious diseases prevail.

Dr. E. B. Frazer, secretary of the board of health of Wilmington, Del., furnishes the following bulletin issued by the board:

OFFICE OF BOARD OF HEALTH,
Wilmington, Del., July 20.

In view of the exaggerated reports which have been published of the prevalence of small-pox in this city, the board of health thinks it proper to state that the number of new cases of this disease for the week ending July 13 was 19, and the past week 15.

Some of these have been sent to the hospital and some have died, leaving at present in the city of those who have sickened in the past three weeks about 25 cases, or one case to 1,760 inhabitants.

DR. L. P. BUSH, *President.*

E. B. FRAZER, *Secretary.*

The board has also issued a circular relative to the free vaccination or revaccination of all persons in those portions of the city where the disease exists, and it is insisted upon that all unprotected persons must be vaccinated either by their own physicians or the vaccine physician of the board, or send to hospital all small-pox cases occurring in their families.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

Dr. J. C. Whiting furnishes the following list of members of the board of health of Pensacola, Fla:

Dr. R. B. S. Hargis, Dr. J. C. Whiting, secretary: Judge. G. A. Stanley, and D. G. Brent, appointed by the governor, under act of the legislature, approved March 7, 1881. The mayor of the city, J. M. Tarble, and the president of the county commissioners, B. R. Pell, are *ex-officio* members of the board.

HAVANA, CUBA.—Advices received from Havana to July 16 indicate the increase of yellow fever in that city. During the week ending July 15, there were 16 deaths from the disease, with about 110 cases in the city. There have also been 10 deaths from small-pox during the past week.

The shipping at Santiago de Cuba has been invaded by yellow fever, and the disease still prevails at Sagua la Grande. At the latter place it has assumed a very malignant type, and people who have been residents for eight or ten years, and have heretofore escaped the fever, are being attacked by it.

Information has also been received that yellow fever has broken out at Cardenas, and that several cases have occurred within the past eight days. The shipping in the harbor, however, has not yet become infected.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

The following reports for the week ending July 16, 1881, are from places where burial permits are not required:

Allegheny, Pa., 79,000; deaths, 75; under 5 years, 45; accidents 2, cerebro-spinal meningitis 1, diarrhœal diseases 23, diphtheria 1, typhoid fever 4, scarlet fever 2. Bucyrus, Ohio, 3,350; no deaths. Bath, Me., 8,000; deaths, 2; accidents 1. Belfast, Me., 5,308; deaths, 1; cerebro-spinal meningitis 1. Columbus, Ga., 10,123; deaths, 1. National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, AUGUST 6, 1881. [No. 6.

CONFERENCE ON SMALL-POX.

The State Board of Health of Illinois called a conference of delegates from State and municipal boards of health to meet in Chicago, June 29th, to consider and adopt measures for the united action of health authorities to prevent the introduction of small-pox into the United States, and its spread from one State into another. Delegates were in attendance from the State Boards of Illinois, Michigan, Iowa, Wisconsin, Indiana, Minnesota, Maryland, and New York; from the National Board of Health and from the municipal boards of Chicago, Milwaukee, Buffalo, Baltimore. JOHN M. GREGORY, LL. D., President of the State Board of Health of Illinois, was called to the chair, and Dr. HENRY B. BAKER, Secretary of the State Board of Health of Michigan, was appointed secretary. The conference continued in session two days, and closed its proceedings by adopting the following report and resolutions:

The constantly recurring outbreaks of small-pox in various parts of the United States during the past few months and the widespread and fatal prevalence of that disease in many localities demands the most serious consideration of the health authorities of this country. In our opinion this conference should use its utmost power to unite all of the health authorities of the United States in a well-organized plan, not only of stamping out small-pox where it at present exists, but of preventing its farther introduction into the United States and its spread from one State into another. For two or three years prior to 1879 small-pox was almost unknown in the United States; certainly, scarcely a death was reported. The result of a long-continued immunity from this disease is great laxity in regard to vaccination. Large numbers of children born during such periods are allowed to remain unvaccinated in every community. Hence, when small-pox appears after such intervals of immunity from the disease, it spreads with far greater virulence than when vaccination is enforced by the fear which the presence of small-pox creates. In 1879 there were a few deaths by that disease in New York (25) and in San Antonio, Tex., (125), but the country at large enjoyed a remarkable immunity from that affection. The cases in 1879 in New York occurred among unprotected foreigners and those in San Antonio were unprotected New Mexicans. But during 1879 small-pox began to be more than usually prevalent in European seaports and in Canada. Much uneasiness was felt by many of the most vigilant sanitary officers in different parts of the country lest the infection should be brought to this country, especially from the neighboring Province of Canada, particularly at Montreal. In several instances local outbreaks of the disease occurred along the Canada frontier, owing to the importation of the infection through immigrants. Towards the close of the year 1879 there were evidences of a wider distribution of small-pox than could be accounted for by importation from Canada. It appeared in New York, Philadelphia, Chicago, the District of Columbia, and other cities. During the year 1880 these outbreaks became more general and were most marked in the Western and Northwestern States, while in the larger Eastern cities it prevailed with a constantly increasing tendency to become epidemic. The present year, 1881, opened with a wide distribution of the disease, and frequent local epidemics of great severity.

From reliable sources it is known that small-pox prevails to an unusual extent in many of the large cities of the North and West, and that violent and fatal epidemics of this disease are of frequent occurrence in small towns and in small communities of many States.

If, now, we inquire into the cause of this diffusion of small-pox throughout the country, we shall find that immigration is at least an important factor. First, it must be remembered that small-pox became epidemic or certainly unusually prevalent in foreign seaport towns and in Canada in 1878, 1879, and 1880, and is at present the prevailing epidemic disease in these towns. From the following table it appears that the tide of immigration to this country from Europe began to rise in 1879, and in 1880 reached proportions hitherto unprecedented in the history of immigration to this country. And still the tide is rising, as appears from the following late reports of the Chief of the Bureau of Statistics at Washington, viz: for nine months ended March 31, 1880, 244,596; for the same period in 1881, 357,396. The total increase in the number of immigrants during the last nine months is 142,800. From still later reports we learn that the arrival of immigrants at the principal ports of the United States is yet on the increase. Indeed, it is no unusual occurrence to witness the arrival of from 6,000 to 8,000 immigrants at the port of New York in a single day.

Second.—It must be noticed that the immigrants are largely from Germany, England, Wales, Ireland, Scotland, and the Dominion of Canada, countries in which small-pox has been, and still is, unusually prevalent. The number of immigrants arrived during the eleven months ended May 31, 1881, was as follows: From Germany, 175,306; Dominion of Canada, 110,611; England and Wales, 57,861; Ireland, 61,796; Scotland, 12,628; China, 7,443; and from all other countries, 138,649. Total, 564,294.

Third.—The number of cases of small-pox arriving on immigrant ships at the ports of the United States is unusually large, as reported by the health officers of the several ports of arrival. With rare exceptions the sick immigrant is not effectually isolated from the steerage passengers. The hospital quarters are usually amidships, with no adequate means of seclusion nor independent ventilation. As a consequence 1,000 to 1,500 persons are more or less directly exposed to the contagion and infection; nor is vaccination of the passengers practiced or even attempted at sea, so that when the ship reaches its destination it may have on board many persons who are thoroughly inoculated with the contagion, though as yet apparently perfectly well.

Fourth.—Another important fact is the rapidity of ocean transit, which must be taken into consideration in estimating the influences of immigration on the importation and dissemination of small-pox. While the incubation period of small-pox is fourteen days, eight to twelve days is the average period of the voyage of the immigrant vessel arriving at New York, where the greater number of immigrants land. Now, it is a well ascertained fact that the emigrants reach the ports of embarkation commonly several days before the sailing of the ship. During this interval the emigrant families take quarters in the low lodging houses about the docks and wharves in which small-pox is now very prevalent. The result is that the unprotected emigrants become infected, and if they immediately embark they may not only reach the port of destination before the incubation period has passed, but may pass the quarantine in apparently perfect health. And, what is still more important, if such infected immigrants immediately on landing take passage on board the immigrant trains, as vast numbers do, they may reach the most distant settlements before the disease finally develops. It is quite plain that under these circumstances no amount of vigilance in merely searching for the sick can prevent the introduction and wide dissemination of small-pox in this country. And this conclusion has tenfold force when applied to the introduction of small-pox from the Dominion of Canada by means of immigrants.

Fifth.—It is a noticeable fact that large numbers of immigrants are found, on inspection, to be unvaccinated. This might be inferred from the fact that such a large proportion of the total number are children. Of the 457,257 immigrants arriving in the year 1880, 87,154, or about one-fifth, were under 15 years of age. It is found also that an intense prejudice exists against vaccination on the part of several nationalities. In several instances compulsory measures have been resorted to at the port of New York to compel the vaccination of unprotected persons who have been exposed to the infection. These immigrants have been known to wash their vaccination wounds immediately after the operation, and in some instances they have been detected having another person, as the mother of a child, suck the wound to remove the virus.

The measures at present adopted and relied on to prevent the introduction and spread of small-pox in the United States by immigrants are evidently inadequate to meet existing conditions. Our health officials are pursuing the methods of prevention in vogue before the era of steam ocean and land travel. Thus far at the port of arrival the health officer takes cognizance only of vessels having well marked small-pox cases on board, either in transit or on arrival. In this case the vessel is subjected to cleansing and disinfection, and the passengers are vaccinated and allowed to depart, no further care being taken to insure successful disinfection of baggage, nor of the vaccination of the unprotected. The immigrant trains proceed to their destination, scattering their occupants along the way without further sanitary care or inspection. Wherever the immigrant stops

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

THE NATIONAL BOARD OF HEALTH.

OFFICERS.

JAMES L. CABELL, LL. D., &c ..... *President.*
JOHN S. BILLINGS, Surgeon United States Army ..... *Vice-President.*
THOMAS J. TURNER, Medical Director U. S. Navy ..... *Secretary.*

MEMBERS.

The following reports for the week ending July 16, 1881, are from places where burial permits are not required:

Allegheny, Pa., 79,000; deaths, 42; under 5 years, 31; accident 1, consumption 4, diarrhœa 12, diphtheria 2, erysipelas 1, typhoid fever 4, scarlet fever 2. Belfast, Me., 5,308; death, 1. Brattleboro', Vt., 6,000; death, 1; consumption 1. Bucyrus, Ohio, 3,950; no deaths. Calais, Me., 6,172; death, 1; consumption 1. Carrollton, Miss., 601; no deaths. Clinton, Mich., 1,200; no deaths. Corinth, Miss., 1,264; no deaths. Crystal Springs, Miss., 955; no deaths. Decatur, Miss., 1,000; no deaths. Fayette, Miss., 400; no deaths. Greenville, S. C., 6,159; death, 1; accident 1. Gunn City, Mo., 150; no deaths. Hernando, Miss., 1,000; deaths, 10; accident 1, consumption 1, diarrhœa 3, malarial fever 3, congestion of the lungs 1, bronchitis 1. Huntingdon, Pa., death, 1; under 5 years, 1; diarrhœa 1. Huntingdon, Tenn., 1,200; deaths, 2. Iuka, Miss., 816; no deaths. Jefferson, Tex., 3,250; deaths, 2; under 5 years, 1. La Salle, Ill., 8,885; deaths, 5; under 5 years, 3; diarrhœa 2, consumption 1, whooping-cough 1. Louisiana, Mo., 5,000; deaths, 5; under 5 years, 4; consumption 1, diarrhœa 4. Madison, Ind., 9,009; deaths, 3; under 5 years, 1; diarrhœa 1. Martinsburg, W. Va., 6,334; deaths, 5; under 5 years, 3; diarrhœa 3. Milan, Tenn., 1,800; deaths, 2; consumption 1, diarrhœa 1. Milford, Mich., 1,400; no deaths. Milledgeville, Ga., 3,000; deaths, 2; puerperal 1. Muscatine, Iowa, 8,412; deaths, 4; under 5 years, 3; cerebro-spinal meningitis 1, diarrhœa 2. Muskegon, Mich., 11,300; deaths, 16; under 5 years, 12; accident 1, diarrhœa 6, diphtheria 3, malarial fever 3, scarlet fever 2, measles 1. Painesville, Ohio, 5,504; no deaths. Pass Christian, Miss., 4,500; no deaths. Pearlington, Miss., 1,200; no deaths. Pleasant Hill, Miss., 253; no deaths. Port Gibson, Miss., 1,200; death, 1; diarrhœa 1. Port Royal, S. C., 750; death, 1; under 5 years, 1. Rensselaer, Ind., 900; no deaths. Santa Cruz, Cal., 5,000; no deaths. Senatobia, Miss., 935; no deaths. Starkville, Miss., 1,454; no deaths. Tampa, Fla., 740; death, 1; under 5 years, 1; diarrhœa 1. Titusville, Pa., 9,046; no deaths. Tuscaloosa, Ala., 2,017; death, 1; consumption 1. Winchester, Va., 5,000; deaths, 3; consumption 1. Youngstown, Ohio, 15,421; deaths, 9; cerebro-spinal meningitis 1, diarrhœa 7. Total population, 232,431; deaths under 5 years, 70; total number of deaths, 119; annual death rate per 1,000, 26.7.

NOTICE.—In filling the reports on the postal cards for cities and hospitals, the figures are frequently so placed between the lines as to leave the disease intended entirely uncertain, except in cases where the judgment of the compiler may enable him to determine which is meant. This may be avoided by a stroke of the pen after the disease to be recorded. The *total* numbers should be placed in their proper columns, and no figures placed immediately after the word *total* will be noted in the tables. Those who report *still-births* will please note them separately, as they are not included in the tables of mortality in the BULLETIN.

NATIONAL BOARD OF HEALTH rooms are at 1410 G street, northwest.

[Continued from first page.]

he seeks the low lodging-house, and there the disease that he has carried in his system from the port of embarkation may first develop itself and establish a focus or infection which may and often has of late involved a whole town in disaster. The first knowledge that the local health authorities have of the arrival of the pestilence is its apparently sudden outbreak. It is evident not only from our past experience, but from the nature of the case as developed in the preceding recital of facts, that the methods we are now pursuing will not prevent the introduction of small-pox into the United States, nor control in any proper sense its spread. There is every indication that the amount of immigration will not be diminished, and that small-pox will become more and more prevalent abroad. To meet this emergency it is the duty of this conference to determine upon a practicable plan of concentrated operations adequate to accomplish the purpose in question. In this view the following scheme is proposed for consideration:

It is evident we can no longer rely simply on quarantine rule, which secures vaccination only of those on board vessels having had small-pox cases during the voyage. The future rule must be that all immigrants shall give satisfactory evidence of being protected against small-pox before being allowed to land. There are two methods of accomplishing this object:

(1.) The restrictions of quarantine may be so applied as to make obligatory upon steamship owners to cause a medical inspection of all emigrants when they embark, and vaccination of all persons found unprotected. If this plan were carried out in good faith scarcely an immigrant could reach our ports who would develop small-pox. He could only carry the infection in his baggage. But, if proper sanitary care of the baggage was required, that also could be relieved of infection on the voyage. It is doubtful, however, if these measures could be fully carried into effect without Congressional legislation, and it should be a part of the action of this conference to secure the insertion of such provisions into the bill pending before Congress regulating immigration as will accomplish the results mentioned.

(2.) The second method is the establishment of medical inspections of all steerage passengers at the ports of arrival in the United States with power to vaccinate all persons found unprotected. This method can be put into operation at once by adding to the rules regulating quarantine one requiring the inspection and vaccination of all immigrants found unprotected. In localities or ports where local boards make the rules governing quarantine, this rule could be at once adopted. Where State legislation is necessary to make the rule, which cannot be attained, the National Board of Health could make the rule and render it effective. Or the National Board of Health could make the rule for the several great immigrant ports, and the local officers could enforce it. From the following table it appears that the number of immigrant ports is very few and can be readily brought under a system of efficient inspection:

Customs districts at which arrived.	Total immigrants for year ending June 30, 1880.		
	Males.	Females.	Total.
Alaska	95	12	107
Baltimore	10,071	7,323	17,394
Boston	18,797	15,265	34,062
Buffalo	484	533	1,017
Charleston	3	1	4
Chicago	250	138	388
Cuyahoga, Ohio	38	16	54
Detroit	2,565	2,356	4,921
Duluth	698	169	867
Galveston	7	.....	7
Gloucester, Mass	306	16	322
Port Huron	60,610	33,765	94,375
Key West	645	351	996
Marblehead, Mass	3	5	8
Michigan	168	53	221
Milwaukee	11	16	27
Minnesota	1,163	562	1,725
New Bedford, Mass	172	102	274
New Haven	6	3	9
New Orleans	1,744	919	2,663
New York	165,303	98,423	263,726
Oregon	691	.....	691
Oswego	65	33	98
Passamaquoddy	1,974	912	2,886
Pearl River, Miss	1	.....	1
Philadelphia, Pa	13,794	7,933	21,727
Portland and Falmouth, Me	31	22	53
Providence	4	.....	4
San Francisco	6,752	401	7,153
Saint Mark's, Fla	15	5	20
Superior, Mich	1,157	300	1,457
Total	287,623	169,634	457,257

Through six ports it appears that the class of immigrants requiring inspection pass into the United States, viz, New York, Boston, Philadelphia, Baltimore, Detroit, Huron, and San Francisco. To these, perhaps, should be added Passamaquoddy Bay, Maine, and Minnesota. It is evident that a system of inspection and vaccination, such as here proposed, at the first arrival must be attended with as little detention as possible. Detention of three days for observation of the results of vaccination would result in the constant collection of from 20,000 to 30,000 persons in the quarantine of New York. Not only would such detention be unadvisable, owing to the hardship which it would create, but as a sanitary measure those vast hordes should be dispersed as rapidly as possible and aided, rather than hindered, in their efforts to reach their future homes.

To meet the exigency which requires future inspection of those vaccinated, to verify the results, local inspection stations might be established at proper points along the great thoroughfares which the immigrant trains travel, where but a momentary detention would be required to reinspect the vaccinated and when necessary to revaccinate. This inspection would be facilitated if a system of ticketing was followed, which might be arranged as follows: Let the port inspector give to every person found to be protected a white card, having on it his name, age, nationality, date of inspection, and destination; to every person requiring vaccination let him give a red card, indorsed like the other, but giving date of vaccination. The immigrants would see that henceforward they must exhibit those cards when called upon. On inspection at a station those having white cards would be no further noticed, while those having red cards would be inspected as to vaccination. The number of inspection ports would not be large, as the routes of immigrant travel are well established. Buffalo, Pittsburgh, Wheeling, Cincinnati, Cleveland, Chicago, Saint Louis, Kansas City, and Saint Paul occur as centers through which most of this travel might be intercepted.

(3.) Within the State where the immigrants disperse for settlement there should be organized by the State board of health a system of surveillance which would keep them under observation until they reached their final destination. Such a system need not be complicated nor expensive, for the same tickets would be the means of preserving the identity of the individual. State boards of health have also an important duty to perform in securing vaccination. Through their official position they can exert a powerful influence upon the people by advice, and can organize many methods of bringing every community to feel a due sense of its obligation to adopt this measure of prevention.

(4) Finally, the local health authorities could maintain, as far as necessary, a certain watchfulness over the immigrant family, in order to discover the first evidence of suspicious sickness.

But a more important duty rests upon the local boards, viz, persistent efforts to secure vaccination of every unprotected person within their jurisdiction. At this time, when there is great popular alarm in regard to small-pox, local boards should use their utmost efforts to make vaccination and revaccination (the only real safeguard against small-pox) universal. Vaccination should not only be offered but urged persistently upon those who neglect it, and restrictive measures, as expulsion from the public schools, should be enforced against those who refuse.

THE RESOLUTIONS.

Resolved, 1. That small-pox is very prevalent in European ports at which emigrants embark for the United States, and, owing to the customary delay of the emigrants at these ports, unprotected persons are liable to, and frequently do, become infected with that disease.

2. That vast numbers of emigrants are unprotected against small-pox infection, and hence contract the disease just before embarking for the voyage.

3. That ocean transit is now so rapid that a person becoming infected with the small-pox poison may, and often does, reach the ports of the United States, and, even by rapid railroad travel, may locate in Western towns before the disease becomes apparent in the individual.

4. That outbreaks of small-pox in many parts of the United States and the liability to a wide and constant dissemination of the contagious and infectious material of that disease by means of the immense number of unprotected immigrants who daily land at our ports and immediately proceed to inland districts by railroad, demands the most energetic measures of health authorities to control the spread of this pestilence, and to exterminate it wherever it makes its appearance in any community.

5. That to accomplish this desirable object there should be concert of action among the several sanitary organizations of the country, viz, national, State, and municipal, and each in its own sphere should use its utmost power to stamp out this disease.

6. That, with a view to give practical effect to the objects of this conference, we recommend—

(A.) That Congress incorporate into the law regulating immigration a provision requiring protection from small-pox by successful vaccination of all immigrants.

(B.) That the National Board of Health is requested to consider (in accordance with an act to prevent the introduction of contagious or infectious diseases into the United States, approved June 2, 1879) the propriety of making, promulgating, and enforcing rules requiring the inspection at the port of departure of immigrants into this country, and the vaccination or revaccination of every immigrant who, upon such inspection, is found unprotected from small-pox. Or, failing in any case or for any cause to secure such vaccination or revaccination, to prevent such unprotected persons as may have

come from or through any infected district from taking passage on any ship destined for this country during the period of the incubation of the disease until such time shall have elapsed as shall make it certain that they are not carrying the germs of small-pox in their own persons.

(C.) That notification be sent to the various steamship companies bringing immigrants to the United States, that unless satisfactory evidence of recent vaccination be furnished (by certificate or otherwise) in the case of each immigrant arriving at any port of the United States, such vessels should be quarantined for a sufficient time to insure the development of all undeveloped cases of small-pox, as well as for the discovery, if possible, of concealed existing cases which have developed during the voyage.

(D.) That local health authorities should as far as practicable cause a thorough inspection of immigrants at all distributing points, and the detention at such points of all suffering from small-pox, and also the vaccination by the local authorities, if needed, of all immigrants who arrive at their destination.

(E.) That to meet present emergencies the National Board of Health, by virtue of its power to prevent the introduction of contagious and infectious diseases into the United States and their spread from one State into another, take such measures as will secure the inspection of every immigrant before landing at the ports of the United States, and of the vaccination of all persons not protected.

(F.) That a committee consisting of one from each State and local board represented be appointed, whose duty it shall be to take such measures as may be found necessary to accomplish the objects of these resolutions.

ACTION OF STATE BOARDS OF HEALTH IN REGARD TO THE INTRODUCTION AND SPREAD OF SMALL-POX IN THE UNITED STATES.

STATE BOARD OF HEALTH OF NEW YORK.

The following preambles and resolutions were adopted by the New York State board of health June 22:

Whereas it is believed that small-pox is at the present time prevailing as an epidemic in some of the ports of the British Islands and of continental Europe; and

Whereas the emigration from those countries to the United States, principally through the port of New York, is at the present time unprecedented in its extent, and recognizing the fact that the incubative period of the disease is greater than the average passage of steamships from such ports to ports in the United States, thus affording an opportunity for emigrants infected at the port of departure to pass our quarantines and reach interior communities before the development of the disease:

Resolved, That this board request the National Board of Health, as a necessary measure of inter-State quarantine, to appoint an inspector of emigrants at Buffalo and Suspension Bridge, whose duty it shall be to examine all emigrants passing through or stopping off at the places mentioned.

And this board further respectfully recommend that the National Board of Health establish such inspections at Chicago, Pittsburgh, Saint Louis, and Omaha during the epidemic prevalence of small-pox at the ports from which emigrants embark.

STATE BOARD OF HEALTH OF ILLINOIS.

At a meeting of the Illinois State board of health, held June 30, the following resolutions were unanimously adopted, and transmitted for publication by Dr. John H. Rauch, secretary:

Resolved, That the Illinois State board of health cordially approves the action of the sanitary conference held in Chicago on the 29th and 30th of June, instant, for the prevention of the introduction of small-pox into this country by immigration and its spread from one State to another, and will co-operate, to the full extent of its power and means, in the proposed effort to unite all health authorities in a systematic plan of operations to prevent the extension of this disease and secure general vaccination.

Resolved, That in view of the occurrence of small-pox in this State in epidemic form, through the dissemination of the contagion by emigrants arriving at the ports of the United States, the National Board of Health be, and is hereby, respectfully requested to secure the vaccination of all unprotected immigrants before they are allowed to leave the ports of arrival in this country.

Resolved, That in accordance with the above the State board of health respectfully and earnestly call upon all health officers and local boards of health in this State to secure a careful inspection of all immigrants entering the State, and a prompt vaccination or revaccination of all persons not thus protected against small-pox.

STATE BOARD OF HEALTH OF MICHIGAN.

The State board of health of Michigan adopted the following preambles and resolutions July 12, and transmitted by Dr. Henry B. Baker, secretary:

Whereas many more immigrants enter the United States by the port at the city of Port Huron, Mich., than by any other port in this country, New York only excepted, the numbers at Port Huron being about 100,000 annually, and no quarantine or inspection is maintained there by any health authority; and

Whereas the country is suffering from contagious diseases, and especially small-pox, introduced in many cases by immigrants, their baggage, wearing apparel, &c., and it is a matter of national importance that the introduction of these diseases be checked as soon as possible; and

Whereas, while the laws of Michigan provide for quarantine and disinfection by the local health authorities at expense of persons quarantined, there is no State or municipal fund available for inspection, vaccination, and disinfection of persons and things in transit and without detention: Therefore,

Resolved, That in accordance with section 3 of an act to prevent the introduction of infectious and contagious diseases into the United States, approved June 2, 1879, the National Board of Health is respectfully requested to make and submit for approval by the President of the United States "such additional rules and regulations as are necessary," and either authorize this State board to execute such rules and regulations, at the expense of the National Board of Health, or appoint a health officer of the port, or a sanitary inspector of the port, and such assistants as may be necessary, at the city of Port Huron, Mich., whose duties shall be to examine, while in transit and without detention, all immigrants arriving at that port; to detain, or effectually *isolate in transit* all persons suffering from small-pox, diphtheria, scarlet fever, typhus fever, cholera, yellow fever, or any other disease dangerous to the public health; to disinfect all infected baggage, wearing apparel, cars, vessels, ferry boats, &c., and to vaccinate, with pure and fresh bovine vaccine virus, all immigrants unprotected from small-pox, and recently exposed to that disease, or coming from or through infected places; to report to the National Board of Health respecting all vaccinations and revaccinations made by them; to co-operate with State and other boards of health, and to promptly communicate to such boards of health information relative to the entry or proposed entry within their jurisdiction of immigrants, and the facts respecting their liability or non-liability to introduce any disease dangerous to the public health.

Resolved, That the National Board of Health is respectfully requested to consider the propriety of taking action, similar to that requested relative to Port Huron, respecting other ports to the eastward of this State where such action as is herein suggested, has not been inaugurated, and from whence immigrants come and pass into and through this State, and may thus endanger citizens of Michigan more than do immigrants by way of Port Huron, many of whom pass directly on to cities and States farther west.

Whereas immigrants exposed to small-pox in foreign countries may contract the disease, cross the ocean, and reach places far inland in this country before the disease manifests itself in their persons; and

Whereas vaccination on arrival in this country is usually too late to prevent the occurrence of the disease in susceptible persons exposed to small-pox on the other side of the Atlantic Ocean: Therefore,

Resolved, That the National Board of Health is hereby earnestly requested to consider (in accordance with an act to prevent the introduction of contagious or infectious diseases into the United States, approved June 2, 1879) the propriety of making, promulgating, and enforcing rules requiring the inspection at the port of departure of immigrants into this country, and the vaccination or revaccination of every immigrant who, upon such inspection, is found unprotected from small-pox. Or, failing in any case for any cause to secure such vaccination or revaccination, to prevent such unprotected person as may have come from or through any infected district from taking passage on any ship destined for this country or, at least, from landing in this country during the period of incubation of the disease and until such time shall have elapsed as shall make it certain that they are not carrying the germs of small-pox in their own persons.

Resolved, That the Michigan State board of health cordially approves the action of the sanitary conference held in Chicago June 29 and 30, for the prevention of the further introduction of small-pox into this country by immigrants, and its spread from one State into another, and that in the proposed effort to unite all health authorities in an organized plan of concerted action to prevent the extension of small-pox and to secure future immunity from small-pox by means of general vaccination, this board will co-operate to the full extent of its powers.

Resolved, That the attention of every local board of health in Michigan is respectfully asked to the details of the plan for immediate action recommended by the late sanitary conference at Chicago,

which, in connection with the preceding preambles and resolutions, is further indicated as follows:

"That to meet present emergencies the National Board of Health, by virtue of its power to prevent the introduction of contagious and infectious diseases into the United States and their spread from one State into another, be requested to take such measures as will secure the inspection of every immigrant before landing at the ports of the United States, and of the vaccination of all persons not protected.

"That local health authorities should, as far as practicable, cause a thorough inspection of immigrants at all distributing points, and the detention at such points of all suffering from small-pox, and also the vaccination by the local authorities, if needed, of all immigrants who arrive at their destination.

"Finally, the local health authorities could maintain, as far as necessary, a certain watchfulness over the immigrant family in order to discover the first evidence of suspicious sickness.

"But a more important duty rests upon the local boards, viz, persistent efforts to secure vaccination of unprotected persons within their jurisdiction. At this time, when there is great popular alarm in regard to small-pox, local boards should use their utmost efforts to make vaccination and revaccination (the only real safeguard against small-pox) universal. Vaccination should not only be offered, but urged persistently upon those who neglect it, and restrictive measures, as expulsion from the public schools, should be enforced against those who refuse."

Resolved, That, in accordance with the foregoing, the State board of health respectfully and earnestly calls upon all health officers and local boards of health in Michigan to secure a careful inspection of all immigrants entering and remaining within their jurisdiction, and a prompt vaccination or revaccination (with pure and fresh bovine vaccine virus) of all persons not protected against small-pox: these precautions being especially necessary respecting immigrants, because of their having come in contact with people and baggage from nearly all parts of the world, and therefore very much more liable to have picked up the contagia of diseases than are our citizens at their homes.

STATE BOARD OF HEALTH OF IOWA.

The Iowa State board of health adopted the following resolutions, which were transmitted by the secretary, Dr. R. J. Farquharson:

The Iowa State board of health indorses the action of the sanitary conference, held in Chicago June 29 and 30, for the prevention of the introduction of small-pox by immigration, and its spread from one State to another, and will unite and co-operate, to the full extent of its power and means, in a systematic plan of operation to prevent the extension of this disease and secure general vaccination.

In view of the fact of the frequent introduction of small-pox into the interior of Iowa from immigrants, the Iowa State board of health would respectfully request the National Board of Health to secure the vaccination of all unprotected immigrants before they leave the ports of arrival in this country.

The Iowa State board of health therefore earnestly requests all health officers and local boards of health to secure a careful inspection of all immigrants entering this State, and a prompt vaccination and revaccination of all persons not sufficiently protected against small-pox.

ABSTRACTS FROM CONSULAR REPORTS.

BORDEAUX, FRANCE.—United States Consul George W. Roosevelt reports that during the month of June there were 466 deaths, of which 28 were from small-pox, 5 from typhoid fever, and 18 from other contagious and infectious diseases.

BRIDGETOWN, BARBADOES.—United States Consul W. H. Polleys reports for the month of June that there were 82 deaths, of which 3 were from yellow fever and 1 from typhoid fever.

BUENOS AYRES, ARGENTINE REPUBLIC.—United States Consul E. L. Baker reports 490 deaths during the month of May. Of these 29 were from typhoid fever and 12 from diphtheria. He also states that the low temperature and humidity of the atmosphere have produced an increase of rheumatism, catarrh, and pulmonary diseases. Typhoid fever still continues very prevalent.

FREETOWN, SIERRA LEONE, WEST COAST OF AFRICA.—United States Consul Judson A. Lewis reports 60 deaths during the month of June, and that the prevailing disease is remittent fever. There has been no epidemic since 1872, when yellow fever was brought to this port in a vessel.

GHENT, BELGIUM.—United States Consul Thomas Wilson reports that during the month of June there were 263 deaths, of which there were from typhus fever 7, from scarlet fever 7, diphtheria 8, consumption 55, bronchitis 38, enteric diarrhœa 40.

GUAYMAS, MEXICO.—For the month of June the United States consul reports 15 deaths: 9 cases are reported as caused by fever. The mortality for the half year concluded June 30, including suicides, accidents, and homicides, is 88.

The weather is hot, but it does not interfere with the sanitary condition of the city which is very good.

MAZATLAN, MEXICO.—The United States consul reports that for the months of April, May, and June there were 195 deaths, of which 33 were from fever, 28 from consumption, and 47 from tetanus.

MALTA AND GOZO.—For the two weeks ending June 30, the United States consul reports 151 deaths; the prevailing disease was enteritis among children.

NASSAU, NEW PROVIDENCE.—United States Consul Thomas J. McLain reports that for the two weeks ending July 9 there were no prevailing diseases excepting local fevers incident to the summer season. The board of health is vigilant and thorough in the performance of their duties, and the sanitary condition of the city is good.

RIGA, RUSSIA.—P. Bomholdt, United States consul, reports that during the month of May there were 464 births and 361 deaths. The principal causes of death were as follows: From consumption, 47; convulsions, 40; small-pox, 40; inflammation of lungs, 24; croup, 9; diarrhœa, 9; diphtheria, 8; accidents, 8; typhoid fever, 8; scarlet fever, 6; measels, 5; puerperal fever, 1; whooping-cough, 1; and 156 in which causes of death were not registered.

SANTIAGO DE CUBA.—The United States consul reports that for the month of June there were 120 deaths, of which 5 were from small-pox and 3 from yellow fever. The cases of yellow fever reported occurred among the troops, who are Spaniards. The harbor and vicinity being still free from yellow fever or small-pox, clean bills of health are issued to vessels bound for the United States when no contagious disease exists on board.

SYDNEY, AUSTRALIA.—The number of deaths for the month of April is reported as having been 150. Of this number local diseases gave 34.0 per cent., among which were apoplexy 3, paralysis 3, convulsions 8, heart disease 9, bronchitis 6, enteritis 4, and nephria 3. Constitutional diseases gave 22.0 per cent. Among these there were from phthisis 10, tabes mesenterica 5, and cancer 4. The percentage of deaths from zymotic diseases was 18.0. Typhoid fever caused 5 deaths, diarrhœa 9, and intemperance 6.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

BRAZOS DE SANTIAGO, TEX.—Official advices announce the prevalence of an epidemic of yellow fever of most virulent type at Vera Cruz, Mexico. It is also stated that small-pox exists in most malignant form.

HAVANA, CUBA.—Advices from Havana state that for the week ending July 22 there were 21 deaths from yellow fever, with about 120 cases of the disease in the city. The shipping at Cienfuegos has also been invaded by yellow fever, three vessels having suffered, and that for the week ending July 29 there were 31 deaths from yellow fever. Of the decedents 8 were private citizens or sailors of merchant vessels and the remaining 23 deaths occurred in the military hospital.

NEW ZEALAND.—The registrar-general's report for the month of April states that there were 158 deaths during the month. Of these 32 were from zymotic diseases, 18 from constitutional diseases, 29 from local diseases, 16 from developmental diseases, and 3 from violence.

WILMINGTON, DEL.—Dr. E. B. Frazer, secretary of the board of health, reports, under date of August 2, that small-pox is decreasing. The total number of cases in the city and at hospital during the month of July was 25.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, AUGUST 13, 1881. [No. 7.

ADULTERATION OF FOODS AND DRUGS.

The progress of sanitary legislation is in no respect more marked than in the enactment of laws to prevent the adulteration of food or drugs. The following act passed the legislature of the State of New York, at its last session:

SECTION 1. No person shall, within this State, manufacture, have, offer for sale, or sell any article or food or drugs which is adulterated within the meaning of this act, and any person violating this provision shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be punished by fine not exceeding fifty dollars for the first offense, and not exceeding one hundred dollars for each subsequent offense.

SEC. 2. The term "food," as used in this act, shall include every article used for food or drink by man. The term "drug," as used in this act, shall include all medicines for internal and external use.

SEC. 3. An article shall be deemed to be adulterated within the meaning of this act—

a.—In the case of drugs:

1. If, when sold under or by a name recognized in the United States Pharmacopœia, it differs from the standard of strength, quality, or purity laid down therein.

2. If, when sold under or by a name not recognized in the United States Pharmacopœia, but which is found in some other pharmacopœia or other standard work on Materia Medica, it differs materially from the standard of strength, quality, or purity laid down in such work.

3. If its strength or purity fall below the professed standard under which it is sold.

b.—In the case of food or drink:

1. If any substance or substances has or have been mixed with it so as to reduce or lower or injuriously affect its quality or strength.

2. If any inferior or cheaper substance or substances have been substituted wholly or in part for the article.

3. If any valuable constituent of the article has been wholly or in part abstracted.

4. If it be an imitation of, or be sold under the name of, another article.

5. If it consists wholly or in part of a deceased or decomposed, or putrid or rotten, animal or vegetable substance, whether manufactured or not, or, in the case of milk, if it is the produce of a diseased animal.

6. If it be colored, or coated, or polished, or powdered, whereby damage is concealed, or it is made to appear better than it really is, or of greater value.

7. If it contained any added poisonous ingredient, or any ingredient which may render such article injurious to the health of a person consuming it: *Provided*, That the State board of health may, with the approval of the governor, from time to time declare certain articles or preparations to be exempt from the provisions of this act: *And provided further*, That the provisions of this act shall not apply to mixtures or compounds recognized as ordinary articles of food, provided that the same are not injurious to health and that the articles are distinctly labeled as a mixture, stating the components of the mixture.

SEC. 4. It shall be the duty of the State board of health to prepare and publish from time to time, lists of the articles, mixtures, or compounds declared to be exempt from the provisions of this act in accordance with the preceding section. The State board of health shall also from time to time fix the limits of variability permissible in any article of food, or drug, or compound, the standard of which is not established by any national pharmacopœia.

SEC. 5. The State board of health shall take cognizance of the interests of the public health as it relates to the sale of food and drugs and the adulteration of the same, and make all necessary investigations and inquiries relating thereto. It shall also have the supervision of the appointment of public analysts and chemists, and upon its recommendation whenever it shall deem any such officers incompetent, the appointment of any and every such officer shall be revoked and be held to be void and of no effect. Within thirty days after the passage of this act, the State board of health shall meet and adopt such measures as may seem necessary to facilitate the enforcement of this act, and prepare rules and regulations with regard to the proper methods of collecting and examining articles of food or drugs, and for the appointment of the necessary inspectors and analysts; and the State board of health shall be authorized to expend, in addition to all sums already appropriated for said board, an amount not exceeding ten thousand dollars, for the purpose of carrying out the provisions of this act. And the sum of ten thousand dollars is hereby appropriated out of any moneys in the treasury, not otherwise appropriated, for the purposes in this section provided.

SEC. 6. Every person selling or offering or exposing any article of food or drugs for sale, or delivering any article to purchasers, shall be bound to serve or supply any public analyst or other agent of the State or local board of health appointed under this act, who shall apply to him for that purpose, and on his tendering the value of the same, with a sample sufficient for the purpose of analysis of any article which is included in this act, and which is in the possession of the person selling, under a penalty not exceeding fifty dollars for a first offense, and one hundred dollars for a second and subsequent offenses.

SEC. 7. Any violation of the provisions of this act shall be treated and punished as a misdemeanor; and whoever shall impede, obstruct, hinder, or otherwise prevent any analyst, inspector, or prosecuting officer in the performance of his duty shall be guilty of a misdemeanor, and shall be liable to indictment and punishment therefor.

SEC. 8. Any acts or parts of acts inconsistent with the provisions of this act are hereby repealed.

SEC. 9. All the regulations and declarations of the State board of health made under this act from time to time and promulgated, shall be printed in the statutes at large.

SEC. 10. This act shall take effect at the expiration of ninety days after it shall become a law.

The State Board of Health has perfected the organization of the work of investigation, and assigned subjects as follows:

I. ANIMAL FOOD.

1. Milk: Fresh and condensed. Assigned to Professor Chandler.

2. Butter: Dairy and artificial; cheese; lard; olive oil, and fruit essences. Assigned to Professor Caldwell.

3. Canned meats and animal foods: Meats—fresh, smoked, salted, canned; extracts and essences of meat and fish; gelatine and isinglass. Assigned to Professor Chester.

II. VEGETABLE FOOD.

1. Cereals, and the products and accessories of flour, and bread foods: wheat, rye, barley, and rice; oat-meal; corn-meal; sago; tapioca and leguminous preparations: special artificial foods for infants and invalids; baking powders; cream tartars; bicarbonate of soda; bicarbonate of ammonia: alum powders and the "alum question." Assigned to Dr. Love.

2. Canned fruits and vegetables; preserves; vinegar; pickles; mustard; ginger; spices; antiseptics employed in preserving; glazing and enamel, as affecting food articles. Assigned to Professor Lattimore.

3. Sugars: sirups; molasses; glucose; confectionery; honey, and soda-water sirups. Assigned to Dr. Pitt.

4. Tea; coffee; cocoa. Assigned to Professor Lattimore.

5. Wines; beers; spirits and cordials. Assigned to Dr. Engelhardt.

III. DRUGS.

1. Crude vegetable and animal drugs. Assigned to Dr. Hoffmann.

2. Pharmaceutical chemicals and their preparations. Assigned to Dr. Hoffmann.

3. Organic preparations, employed in medicines; cinchona, opium, &c., and their alkaloids; commercial pills, coated and otherwise; ethers and essences. Assigned to Professor Caldwell.

The secretary of the board, Dr. Elisha Harris, has issued the following circular to the public calling attention to the special features of the law, and inviting the cooperation of the people:

The State board of health is required by this law to take cognizance of the interests of health as they relate to the sale of food and drugs, and the adulterations of the same. For this purpose it has undertaken the necessary investigations, and it now appeals to the people of the State for information and suggestions that may lead to the correction of wrong practices which these provisions of law are designed to prevent.

Information and voluntary reports are specially desired concerning the following points:

In regard to food articles:

1. Whatever is known or suspected of the adulteration of milk, condensed or uncondensed.

2. Whatever is known or suspected of adulterations and spurious materials sold as dairy butter.

3. Whatever is known or suspected of spurious or artificial liquids sold as wine.

4. Whatever spurious or adulterated substances are combined with or sold as sugar.

5. Whatever alkaline and other earthy substance is fraudulently sold as soda and its salts.

6. Whatever artificial mixtures are sold as baking powders, concerning which there is proof of injurious effects on health.

7. Whatever sugars, confections, or other mixtures are known or believed to contain *terra alba* or other earthy and mineral or metallic substances.

8. Whatever substances, mixtures, or compounds recognized or sold as articles of food, drink, or medicine, are in or to be placed in the market for sale, and which are below the natural quality or strength, or which, in the judgment of those concerned, may be sold and used as articles of food, beverage, or medicine, in accordance with the exemptions provided in sections 3 and 4 of chapter 407.

In regard to drugs or medicines:

1. Whatever substances are known or suspected of any adulteration, or any depreciation from the *official* standards of the Materia Medica and the Pharmacopœia, as designated in section 2, chapter 407, of the laws of 1881.

2. Whenever a drug or compound, the composition of which is not established by a national pharmacopœia, shall be manufactured, offered, and used in the State of New York, the standard ingredients of its composition and the range of variability from such standard or standards should be duly certified and officially filed at the office of the State board of health. There are medicinal compounds of this kind of such practical and extensive use that their correct standards should be maintained by whoever makes and sells them.

This board has appointed eight distinguished chemical analysts, located in various parts of the State, to serve under this law. Arrangements have been made for collecting the necessary samples of food-articles and drugs.

Whenever a citizen in this State desires to have samples of food or drugs tested, which are suspected of adulteration or other fault, he will please give notice by mail to Prof. Charles F. Chandler, chairman of the [committee of this board, under whose supervision the analyses and investigations are conducted, who will return his request, &c., concerning the same. The rules he will give in each case for procuring and sealing up samples for analysis should be followed.

REQUESTS.—All who are interested in promoting the welfare of life and health by guarding against adulterated and deleterious articles of food, beverages, and medicines, will please carefully to observe and inquire concerning the illegal traffic in such articles; and this board specially requests that whenever any person is cognizant of a case or cases in which there is or seems to be evidence of poisoning or injury from the use of any food articles, beverages, drugs, condiments, and the accessories of food, information should be immediately given to the State board of health, at its Albany office, and the reason for such opinion should be at once communicated, with the name of the informer. All such names and information will be so reserved, and the board's action will be so directly responsible that no inconvenience shall result to informants.

The State board of health desires the fact to be well understood by the public that this law originated as a national measure for the protection of the people, as recommended by the National Board of Health and National Board of Trade, and that in the State of New York its administration will be based upon effectual co-operation of the State board of health with the people and honest producers and tradesmen, and upon the faithfulness and skill of this board's carefully selected chemical analysts.

QUARANTINE IN LOUISIANA.

Attention is called to the following proclamation of the governor of Louisiana with the amendment thereto under date of July 1, 1881.

QUARANTINE.

Proclamation by the Governor of Louisiana.

Whereas on the 19th of April, 1881, the board of health of the State of Louisiana, in pursuance of law, adopted unanimously a resolution requesting me to issue a proclamation of quarantine, according to section 3049 of the Revised Statutes of the State, to the effect that all vessels arriving after the 1st day of May, 1881, from the following ports known to be infected with yellow fever, namely, Rio de Janeiro, Vera Cruz, Havana, and Aspinwall, and the officers, crews, passengers, and cargoes arriving from the above-named places, or having touched or stopped at any of them, shall be subject to such detention as the board of health may direct; and that, entirely independent of the duration of the voyage, said detention shall embrace not less than three full days (seventy-two hours) at the quarantine stations:

Now, therefore, in accordance with the said section 3049 of the Revised Statutes of Louisiana, which requires and commands that the governor shall issue his proclamation of quarantine upon the advice of the board of health, I, Louis Alfred Wiltz, governor of the State of Louisiana, have thought proper to issue this my proclamation declaring that Rio de Janeiro, Vera Cruz, Havana, and Aspinwall are infected with yellow fever, and I hereby order to be detained at the several quarantine stations all vessels from those ports or vessels which shall have touched or stopped at any of them, and which shall arrive after the 1st day of May, 1881, together with their officers, crews, passengers, and cargoes, for such time in each case as the said board of health may direct, which detention, without regard to the previous duration of the voyage, shall not embrace less than three full days (seventy-two hours) at the quarantine stations.

All vessels, together with their officers, crews, passengers and cargoes, arriving from or having touched or stopped at the above-named infected ports shall be subject, as the law directs, to all regulations passed by the board of health or provided by the laws of the State.

In testimony whereof I have hereunto set my hand and caused the seal of the State to be affixed, at the city of New Orleans, this 22d day of April, A. D. 1881.

LOUIS A. WILTZ.

By the Governor: WILL. A. STRONG, *Secretary of State.*

Amendment.

Whereas the board of health of the State of Louisiana did, on the 9th day of June, 1881, adopt the following resolution, to wit:

"*Resolved*, That his excellency, the governor, is hereby requested to so amend his quarantine proclamation of April 22 as to read 'ten full days (two hundred and forty hours)' instead of as at present, 'three full days (seventy-two hours)', and said amendment to go into effect and apply to all vessels arriving at quarantine station from proclaimed ports, on and after July 1, 1881, all other parts of the existing proclamation to remain as at present."

And whereas at a meeting held June 14, 1881, the said board of health refused to rescind or modify said resolution:

Now, therefore, in accordance with law, I hereby amend my proclamation of quarantine by extending the period of detention as requested in the foregoing resolution.

LOUIS A. WILTZ.

Governor of the State of Louisiana.

[The port of Aspinwall, by resolution of the board of health, is not included in the list of proclaimed ports.]

IMPORTANT TO CONSULAR OFFICERS.

QUARANTINE REGULATIONS IN SOUTH CAROLINA.

The attention of consular officers at all ports liable to become infected with yellow fever is called to the following resolution and instructions adopted by the State board of health of South Carolina. It will be seen by reference to these regulations that all vessels from infected or suspected ports, or that have had cases of contagious disease on board since leaving the port of departure, must report at the quarantine station established by this board on Blackbeard Island, in Sapelo Sound, for such treatment as may be deemed necessary, before they will be permitted to enter any port in South Carolina. To facilitate commerce and obviate delays, it is recommended that consular officers urge upon masters of vessels bound for South Carolina ports the necessity of stopping at the station on Blackbeard Island on their way to the port of destination.

RESOLUTION.

Resolved, That the State board of health of South Carolina accept the use of the national quarantine station at Blackbeard Island, and that the following instructions, signed by the health officers of the ports, be issued to pilots and masters of vessels:

INSTRUCTIONS.

Quarantine notice.—To pilots and masters of vessels.

Pilots will, in all cases, before boarding, make inquiry as to the sanitary condition of vessels bound for this port, or calling for orders.

Vessels from infected or suspected ports, with sickness on board, or on which infectious or contagious disease has occurred, either during voyage or in the port of departure, will be directed to proceed at once to the national quarantine station at Sapelo. In such cases the pilot or pilots will not board. Cases of doubt to be decided by the health officer.

All vessels bound for this port having the certificate of the national inspector will be brought to anchor at the quarantine station of this port, and there remain until released by proper permit from the health officer.

Pilots, captains, and masters of vessels will be held strictly responsible for violations of these orders, and the penalties will be enforced by the health officer.

By order of the State board of health of South Carolina.

———— ————, *Health Officer of* ————.

ABSTRACTS FROM CONSULAR REPORTS.

AMOY, CHINA.—United States Consul W. E. Goldsborough reports for the two weeks ending June 18 that the city of Amoy is free from epidemic, but that the sanitary condition of the city is bad in consequence of the want of cleanliness. The population of the city is estimated at 300,000. During the period covered by the report there were no deaths among the foreign population. The number of deaths among the Chinese cannot be estimated, no official information being given.

BRADFORD, ENGLAND.—United States Consul C. O. Shepard reports that during the week ending July 16 there were fifty-two deaths. The average annual death-rate was 14.7 as against 10.7 and 19.1 corrected death-rates for the corresponding weeks of 1879 and 1880. Among the deaths reported there were 6 from consumption, 8 from acute diseases of the respiratory organs, and 6 from heart disease. The total number of deaths among children under five years of age was 18. Of this number 12 were infants under one year.

CONSTANTINOPLE, TURKEY.—United States Consul G. H. Heap forwards dispatches regarding the plague in Mesopotamia to July 11. The last death from the plague within the infected district occurred on June 27, since which time there have been no new cases. On the recommendation of the chief medical inspector the separate cordons around the several villages where the plague has prevailed have now been raised and one cordon drawn around the extreme limits of the infected country. The plague has now virtually ceased, and the inhabitants of the several villages are permitted to have free communication among themselves, and the cordon above referred to as recently established on the exterior limits of the district is maintained as a precautionary measure, and will be continued until all possible danger of a recurrence of the disease has ceased.

FOOCHOW, CHINA.—In his report for the week ending July 11, United States Consul J. C. A. Wingate states that the population of the city and suburbs is estimated at 1,100,000. No report is made by the authorities of the number of deaths. The general health of the inhabitants is believed to be good, and the city free from epidemic. The sanitary condition of the foreign settlement is good, but of the city proper is very bad, the streets and houses of the natives being generally very filthy.

HAVANA, CUBA.—Advices from Havana state that there have been 36 deaths from yellow fever during the week ending August 5. Of the decedents seventeen were citizens and sailors of merchant vessels, and the remaining nineteen were among the soldiers. There are at present about two hundred cases of yellow fever in the city. The port of Santa Cruz, on the south side of the island of Cuba, has also become infected with yellow fever, a number of cases having recently occurred on board of vessels while there. Small-pox still prevails in Havana to a limited extent, there having been nine deaths during the week.

HONOLULU, SANDWICH ISLANDS.—United States Consul D. A. McKinley reports 57 deaths in Honolulu during the month of June. Among the deaths reported there were, from consumption, 9; convulsions, 5; dropsy, 6; heart disease, 4; syphilis, 7; and small-pox, 3. The number of deaths during the corresponding period for the past five years is reported as follows: June, 1877, 23; June, 1878, 33; June, 1879, 61; June, 1880, 46, and June, 1881, 57.

MOSCOW, RUSSIA.—Acting United States Consul August Weber reports the total number of deaths during the month of April as 2,456. Population, 601,969. Annual death-rate per 1,000, 48.8. Among the deaths reported there were, from chronic affections of the respiratory organs, 368; from acute affections of the lungs, 353; from catarrhus gastro intestinalis, 263; from typhoid fever, 305; from small-pox, 8; from plague, 1; from other contagious or infectious diseases, 134.

NASSAU, NEW PROVIDENCE, BAHAMAS.—United States Consul T. J. McLain, jr., reports to July 16th the health and sanitary condition of the city good. There were but few deaths during the week, and no diseases known to exist except the ordinary bilious and intermittent fevers incident to the hot season.

NINGPO, CHINA.—United States Consul E. C. Lord forwards reports from May 7 to June 11, inclusive. The population of the city is estimated at 300,000. No record of deaths is kept by the authorities. So far as known the city is free from epidemic and in fair sani-

tary condition. The ordinary diseases prevail, there being a number of cases of typhoid fever, while, among children, measles, whooping-cough, and scarlet fever are more or less common.

POINTE-A-PITRE, GUADELOUPE, WEST INDIES.—The United States Consul reports ten deaths for the week ending June 25, one of which was from yellow fever. The sanitary condition of the town is not good.

SINGAPORE, INDIA.—United States Consul A. G. Studer reports the sanitary condition of the city good. The great heat recently prevailing has had a very debilitating effect, and where great care has not been exercised in eating and drinking, cases of dysentery have been common.

VERA CRUZ, MEXICO.—United States Consul S. T. Trowbridge reports 235 deaths from yellow fever and 24 from small-pox during the month of June.

The following reports for the week ending July 30 are from places in which burial permits are not required:

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.

National Board of Health

BULLETIN.

VOL. 3.] WASHINGTON, D. C., SATURDAY, AUGUST 20, 1881. [No. 8.

NOTICE TO QUARANTINE OFFICERS.

Reliable information has been received at this office that vessels on which cases of yellow fever have recently occurred are constantly leaving the port of Havana and other infected ports for ports in the United States without the bill of health required by the statute and regulations of this Board.

All our southern ports, especially, are greatly exposed in consequence of this failure to comply with the law, and quarantine and other health officers are urgently requested to exercise the utmost vigilance in regard to vessels from all ports within the yellow-fever region. It is known, too, that small-pox exists in epidemic form at many of the ports now infected with yellow fever, and to guard the people against the possible ravages of one or both of these dread diseases will require the most careful and determined efforts of health and quarantine officers in each of our southern ports. All vessels, therefore, from ports liable to infections or contagious diseases, especially those in which yellow fever prevails or is likely to occur, should be subjected to the most rigid examination and be regarded as suspected vessels unless provided with the bill of health showing a strict compliance with all the requirements of our law.

No vessel should be allowed to discharge its cargo until every precaution has been taken to prevent the introduction of contagious or infectious diseases into the United States.

LEGISLATION IN DELAWARE.

REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS.

Be it enacted by the Senate and House of Representatives of the State of Delaware, in General Assembly met, as follows:

SECTION 1. The secretary of the State of Delaware shall, on or before the first day of July, A. D. 1881, procure three suitable books for each county in the State, in which respectively may be recorded the births, marriages, and deaths occurring within the State, and furnish one book of each kind to the recorder of deeds in each county.

SEC. 2. It shall be the duty of said recorders to record in said books all such births, marriages, and deaths as the same may be returned or lodged in their offices for that purpose, for which service he shall receive from the county five cents for every certificate so recorded. He shall also, at the end of every three months, furnish a copy of such records for the preceding three months to the secretary of the State board of health, for which copy he shall be paid at the same rate as above provided.

SEC. 3. The books so provided shall be separate and distinct, each from the other, and shall be respectively entitled "The Register of Births," "The Register of Marriages," and "The Register of Deaths," and shall each be furnished with an index. The register of births shall be ruled on each page with columns from top to bottom, each column with an appropriate heading, as follows: Full name of child, sex, color, date and place of birth; father's name, age, occupation, nativity; name of mother previous to marriage, age, nativity; child's number in the family, number by this mother, date of certificate, date of registration [living and still-born].

SEC. 4. It shall be the duty of the physician present at the birth of any child, or (if not present at the time of the birth of the child) who attends the case of any mother during her lying-in period after the first day of July, 1881, to report to the recorder of deeds for the county in which any such child shall have been born the day, month, and year of the birth, the sex and color of the child, and name of the father and mother [with the other facts set forth], on the form to be furnished by the recorder of the county, and return the certificates, so prepared, to said recorder on the first days of January, April, July, and October in each year, together with the facts relative thereto; and every midwife present at the time of or within five days after the birth of any child, where no physician is attending said case, after the first day of July, 1881, shall, within ten days after any such birth, report to the practicing physician residing nearest her place of residence the day, month, and year of the birth, the sex and color of the child, and the name of the father and mother [with the other facts set forth in the recorder's blanks], and the physician shall make return in the same manner as if he had been present at such birth, varying only in stating upon whose information he made the certificate; for which service the physician shall receive five cents for each certificate so returned by him, to be paid by the county in which such return has been made. Each and every birth so returned shall be registered by the recorder under the letter of the alphabet to which they respectively belong, and the birth or births therein certified shall be recorded so as to conform to the form prescribed, as far as possible, and the record need not be a literal copy, only so that it conforms to the facts certified. All certificates so returned to the recorder shall be filed by him, according to the date of the return.

SEC. 5. The register of marriages shall be ruled with columns from top to bottom of each page, and have headings as follows: Full name of groom, age, color, nation or State, residence, occupation; full name of bride, age, color, nation or State; residence, names, and birthplaces of parents, date of marriage, number of previous marriages, name of person solemnizing the marriage, date of certificate, date of registration.

SEC. 6. It shall be the duty of every clergyman, and every magistrate, and of the clerk or keeper of the records of any religious society, by or before whom any marriage or marriages may hereafter be solemnized or contracted, to make a faithful return of the same every three months by returning the certificate or certificates in the form issued by the secretary of state [duly filled and certified] to the recorder of deeds of the county in which such marriage or marriages may have been solemnized or contracted. If any certificate shall contain more than one marriage, the recorder shall register each marriage under the letter of the alphabet to which they respectively belong, and if any certificate be not in due form the marriage or marriages therein certified shall be registered by the recorder in such manner as to conform to the above form as far as practicable, so as to show the facts. All such certificates shall be filed according to their dates.

SEC. 7. The "register of deaths" shall on each page be ruled from top to bottom so as to form appropriate headings, as follows: Name, age, color, nation, or State; if a foreigner, how long in the United States; residence, occupation, married, single or widow, sex, name, and nation of parents, cause of death and complications, date of death, date of certificate, date of registration. Whenever any person shall die, it shall be the duty of the physician attending, or of the coroner, when the case shall come under his notice, to make out under his hand and to furnish to the sexton or undertaker a certificate of said death, according to the form furnished by the recorder of deeds.

SEC. 8. No person having charge as sexton, or otherwise, of any vault, burying-ground, or cemetery, shall inter or allow to be interred or placed in any such vault, burying-ground, or cemetery the dead body of any person without first procuring from the physician in charge, or other authorized person, such certificate or a copy thereof, as prescribed in the preceding section, to be furnished by the recorder of deeds; and if there be no physician in attendance or no coroner, then the undertaker in charge of the body, or the sexton in charge of the vault or burying-ground where the interment will

be made, shall himself prepare a certificate according to the form prescribed in the preceding section; and all such certificates shall be by said sexton furnished every three months to the recorder of deeds of the county in which the death occurred. If any certificate shall contain more than one death, the recorder shall register such death under the letter of the alphabet to which they respectively belong, and if any certificate shall not be in due form, the death or deaths therein certified shall be registered so as to conform to such form as far as practicable. In the case of the city of Wilmington the certificate, when filled and signed as heretofore provided, shall be returned to the register of births, marriages, and deaths for that city, to be by him recorded and returned at the end of every three months to the recorder of deeds of New Castle County, to be registered by him as above directed. It shall be the duty of the register of deaths of the city of Wilmington to publish weekly reports in one or more of the newspapers of that city of the number of deaths, with the diseases, and a summary of the ages of the deceased, and also specify the number of deaths from the county almshouse, and from without the city.

SEC. 9. If any physician, or coroner, or sexton, or magistrate, or midwife, or register of deaths, or clergyman, or clerk of any society, by or before which marriages may be solemnized, shall neglect or refuse to comply with the duties imposed on such person by the preceding sections of this act, he shall be fined not less than five nor more than ten dollars for each and every case so neglected or refused, to be recovered before any justice of the peace of the county in which said delinquent resides, the one-half thereof to the use of the State, and the other half thereof to the use of the person who shall sue for the same.

SEC. 10. The books of registration kept by the recorder, or a duly certified copy thereof, shall be admitted as evidence in any court of law or equity, and in any legal proceedings whatever in this State, where it may be necessary to allege or prove such birth, marriage, or death; the recorder of deeds shall receive the sum of thirty cents for such certificate, and fifteen cents for making a search for birth, marriage, or death, to be paid by the person applying for such certificate or search, but the said register shall at all times be accessible to physicians, clergymen, and lawyers without charge.

SEC. 11. It shall be the duty of clergymen or ministers of religion of all denominations, and magistrates, and of the clerks or keepers of the records of all societies, and of all other persons, by or before whom any marriage may hereafter be solemnized or contracted, and of every practicing physician and midwife, and of the register of births, marriages, and deaths for the city of Wilmington, and of every superintendent or sexton of any cemetery or burying-place, on or before the first day of July, 1881, and thereafter of all such persons as may occupy the positions herein mentioned in this State, to report his, her, or their name or names and place of residence to the recorder of deeds of the county in which such person or persons may then reside; and it shall be the duty of the recorder to have the same alphabetically registered in a suitable book to be by him provided for the purpose. In the event of any of the persons above specified removing to any other place of residence within the State, it shall be the duty of such person to notify the recorder of deeds of the county to which he removes of the fact within thirty days after such removal; and if any person as above mentioned shall neglect or refuse to comply with the requirements of this section, such person shall be fined not less than five dollars or more than ten dollars, to be recovered as provided in section 9.

SEC. 12. Every person who is hereby required to return a certificate of a birth, marriage, or death to the recorder of deeds or register of deaths, and shall accordingly make such return, shall be entitled to receive from the levy court of the county in which birth, marriage, or death took place the sum of five cents for each and every return so made, provided such account shall have been certified by the said recorder or register. The blank forms requisite to carry out the provisions of this act shall be furnished by the recorder of each county to each person or persons who are included in section 11, and who reside in their respective counties; and all the fees and expenses heretofore mentioned shall, when duly certified, be paid by the levy court of each county, except such as pertain to the city of Wilmington.

SEC. 13. All acts and parts of acts inconsistent herewith, or supplied by this act, are hereby repealed.

Passed at Dover, April 7, 1881.

REYNEAR WILLIAMS,
Speaker of the House of Representatives.
CATESBY F. RUST,
Speaker of the Senate.

NOTICE.—All official communications to the National Board of Health should be addressed to the *Secretary* of the Board, Dr. T. J. Turner, U. S. N. Correspondents and others whose writing may be for publication are reminded that much inconvenience is caused by writing on both sides of the paper.

REPORT OF STATE BOARD OF HEALTH OF CALIFORNIA FOR JUNE.

Dr. F. W. Hatch, permanent secretary of the State board of health of California, furnishes the mortality report for the month of June. The record embraces local reports from twenty-four cities and towns in the State, having an aggregate population of 354,092. The total number of deaths was 384, showing an annual death-rate of 13 per 1,000 of the population. The principal causes of death are reported as follows: From consumption, 46; pneumonia, 23; bronchitis, 4; other diseases of the lungs, 9; diarrhœal diseases, 47; diphtheria, 4; scarlatina, 2; measles, 1; small-pox, 2; whooping cough, 2; typhoid and typho-malarial fevers, 8, and cerebro-spinal fever, 3.

As showing the relative mortality from the principal diseases the state is divided into sections, as shown in the following table:

	Population.	Total deaths.	Average rate per 1,000.	Consumption.	Acute lung diseases.	Diphtheria.	Diarrhœal diseases.	Typhoid fever.	Malarial fevers.	Cerebro-spinal fevers.
Coast cities	255,556	267	12.53	27	8	1	35	3	0	2
Coast valleys	23,185	35	16.32	7	5	0	5	1	0	0
Interior valleys	58,751	73	17.28	10	4	3	4	2	1	0
Mountains	14,900	9	7.21	2	0	0	3	0	0	0

The above table of distribution of the principal causes of death includes the report from San Francisco, with a population of 233,956. In order, therefore, that the number of deaths which occurred in the other coast cities during the month may be clearly shown, the following statement of the number of deaths in San Francisco from the several diseases is given: From consumption, 25; acute lung diseases, 4; diarrhœal diseases, 29; diphtheria, 1; typhoid fever, 2, and cerebro-spinal fever, 2.

Comparing this report with that for May from the same places, a slight decrease in the total number of deaths is observed. There was also an increase in the number of deaths from acute diseases of the lungs and from diphtheria, three deaths from diphtheria having occurred at Sacramento. A mild form of diphtheria is also reported as prevailing in Shasta and vicinity, though none of the cases appear to have resulted fatally. Malarial and typhoid fevers show a diminished mortality during this month. These fevers have not yet become greatly prevalent in the central valleys of the State. Sacramento is reported as being remarkably exempt from these diseases.

Below Sacramento, on the Cosumnes River and neighboring plains, remittent fever of a low type is said to be quite prevalent.

Dr. Jones reports from Grass Valley that typhoid fever and diarrhœa are of frequent occurrence. The latter, with cholera infantum, is reported from almost all the localities from which the "sickness" record is received. In Sacramento, while still frequently occurring, these diseases are less observed than during the previous month.

REPORTS OF CORRESPONDENTS OF THE NATIONAL BOARD OF HEALTH.

AMSTERDAM, N. Y.—Dr. S. H. French reports that the total number of deaths during the month of June was 15. Population, 9,360; annual death-rate per 1,000, 19.1.

The causes of death are reported as follows: Cerebro-spinal meningitis, 2; scarlet fever, 1; Bright's disease, 1; other diseases, 10. Cerebro-spinal fever has prevailed to a considerable extent, there having been 16 cases and 4 deaths from this disease since April last.

NEW LONDON, CONN.—Isaac W. Thompson, registrar, reports 12 deaths during the month of June. Of the decedents 1 was under five years of age. Of the deaths reported there were from consumption, 2; croup, 2; typhoid fever, 2, and from other diseases, 6.

OAKLAND, CAL.—Dr. J. R. Radway, health officer, states that during the month of June the total number of deaths was 35. Population, 35,000; annual death-rate per 1,000, 12, a reduction of 1.2 as compared with the mortality for the corresponding period in 1880.

The causes of death are reported as follows: Consumption, 7; typhoid fever, 3; cerebro-spinal meningitis, 1; croup, 1; measles, 1; other diseases, 22. Deaths under five years, 15.

SCRANTON, PA.—T. P. O'Malley, secretary of the board of health, reports a total of 33 deaths during the month of June. Population, 45,850; annual death-rate per 1,000, 8.63. The causes of death are reported as follows: Consumption, 5; bronchitis, 1; pneumonia, 8; typhoid fever, 2; cerebro-spinal fever, 1; diphtheria, 1; measles, 2; affections of the liver, 4; other diseases, 9. Total number of deaths under five years, 9.

CHEMICAL EXAMINATION OF DRINKING WATER.

[REQUEST FOR SPECIMENS OF SUSPECTED WATER.]

A careful study of the chief methods in use for the chemical examination of potable water, so far as organic matter is concerned, has been undertaken by order of the National Board of Health. It is particularly requested of the correspondents of the board, of medical men throughout the country, and of others interested in sanitary matters, that any well-marked case of disease which may seem on medical grounds fairly attributable to organic impurities in drinking water be promptly reported to Dr. J. W. Mallet, University of Virginia Post-office, Albemarle County, Virginia, with a few lines stating clearly the medical nature of the case, and the character of the evidence on which the water in question is suspected of having actually caused disease in persons who have used it.

It is further desired that a sample of each such water be forwarded for examination, *but not until notice has been received from Dr. Mallet that the analysts are ready to proceed with it*, since it is important that no useless delay should occur between the shipping of the sample and its investigation in the laboratory. In notifying any one who may be able to furnish specimens of suspected waters that may be forwarded, clear instructions will be sent as to the quantity of water required, and the mode of collecting, packing, and shipping it.

It is particularly desired that no case be presented on doubtful or vague evidence, since one important object of the inquiry demands that all such be rejected, and only those cases examined which involve the strongest grounds for believing that mischief has really been caused by organically foul drinking water.

The cost of packages and transportation for samples will be borne by the Board of Health.
